Ltd., London.
 Correspondence on behalf of the garrison only.

NOTES—continued

¹⁷ The accounts are settled by the Direction Generale des Services Electriques, Service des Telegraphes, 66 Bureau, Rome, for radiotelegrams exchanged with coast stations, and by the Compagnia Internazionale Marconi, per le Comunicazioni Marittime, via dei Condotti 11, Rome, for radiotelegrams exchanged with ship stations.

¹⁸ Fitted for reception only.

¹⁹ The accounts are settled by the Marconi International Marine Communication Company, Ltd., London.

²⁰ Accounts are settled by the Department of Marine and Fisheries, Ottawa, Ontario.

²¹ Operated by the Marconi Wireless Telegraph Company of Canada, Ltd., Montreal, P.Q.

²² The accounts are settled by the Atlantic Transportation Company, Ltd., Montreal, P.Q.

²³ The accounts are settled by the United Fruit Company, New Orleans.

²⁴ Operated by the Cutting & Washington Radio Corporation, 6 and 8, West 48th Street, New York.

²⁵ When the ship is trading in the Pacific Coast Service.

²⁶ When the ship is trading in the Atlantic Coast Service.

²⁷ See International Time Section of book, for Time of Watches.

²⁸ The accounts are settled by Hon. The Minister of Lands, Victoria, B.C.

²⁹ The accounts are settled by the Grand Trunk Pacific Steamship Company, Vancouver, B.C.

³⁰ The accounts are settled by the Independent Wireless Telegraph Company 42 Broadway, New York (N.Y.).

³¹ The accounts are settled by the Pacific Salvage Company, Victoria, B.C.

³² The accounts are settled by the Ship Owners' Radio Service, Inc.

³³ 0600 to 0800, 1000 to 1200, 1400 to 1600, 1800 to 1900 (Indian standard time, 5 hours, 30 minutes in advance of Greenwich mean time).

³⁴ The accounts are settled by G. P. D'Aigneaux, 24, Ste. Ursule St., Quebec (P.Q.).

³⁵ The station corresponds only with ships belonging to the same company.

³⁶ Correspondence limited to radiotelegrams exchanged with Reederei Behnke and Sieg or with their agents in different ports.

³⁷ Correspondence restricted to radiotelegrams exchanged with Chosen Light-house and Japanese warships.

³⁸ No ship charge.

³⁹ Public correspondence admitted without ship's charge when there is no official correspondence.

⁴⁰ The accounts are settled by the Direction des Télégraphes du Royaume de Danemark, Copenhagen, but accounts for radiotelegrams exchanged directly between ships are liquidated by the Dansk Radio Aktieselskab, Copenhagen.

⁴¹ The accounts are settled by the Yu Fong Steamship Company, 12, Ezra Road,

⁴² The accounts are settled by the Direction des Télégraphes du Royaume de Danemark, Copenhagen, but accounts for radiotelegrams exchanged directly between ships are liquidated by the Deutsche Betriebsgesellschaft für Drahtlose Telegraphie Hallesches Ufer 12-13, Berlin, S.W.11.

⁴³ This charge is reduced to 5 centimes for radiotelegrams exchanged with Leftonian coast stations.

⁴⁴ Operated by the Nederlandsche Radio-Telegraf Co., Amsterdam.—0400 to 0415, 0600 to 0800, 0900 to 1200, 1400 to 1500, 1700, to 1900, 2200 to 2300 (mean time of Java).

⁴⁵ Station temporarily closed.

⁴⁶ Ice-breaker.

⁴⁷ Station is open only during season of navigation (March and April).

⁴⁸ The station exchanges generally radiotelegrams relating to navigation.

⁴⁹ The accounts are settled by the owner.

⁵⁰ The accounts are settled by the Radio Communication Company, Ltd., 34-35, Norfolk Street, Strand, London.

⁵¹ Operated and controlled by the Marconi International Marine Communication Company, Ltd., London.

⁵² When the ship is trading in Fiji or Western Pacific waters.

⁵³ Ship engaged in a regular service between Calais and Dover.

⁵⁴ Ship engaged in a regular service between Dieppe and Newhaven.

⁵⁵ Ship engaged in a regular service between France and Algeria.

⁵⁶ Ship engaged in a regular service between France, Algeria and Tunis.

⁵⁷ Ship engaged in a regular service between France and Corsica.

⁵⁸ Ship engaged in a regular service between France, Corsica and Algeria.

⁵⁹ Ship engaged in a regular service between France and Corsica, Algeria and Tunis.

⁶⁰ Ship engaged in a regular service between France and Tunis.

⁶¹ Operated and controlled by the Société Anonyme Internationale de Télégraphie sans Fils, Brussels.

⁶² The ship charge, without regard to the nationality of the boats, is 14 centimes per word, minimum 1 fr. 40 centimes, for correspondence exchanged with Tralleberg Radio, and 18 centimes per word, minimum 1 fr. 80 centimes for correspondence exchanged with Sassnitz.

⁶³ The station is open the last 20 minutes of each hour, from 0740 to 1800 (local mean time).

⁶⁴ Transmits only radiotelegrams sent by the captain.

⁶⁵ From Dieppe to Newhaven: day service, 1300 to 1630, night service, 0100 to 0530; from Newhaven to Dieppe: day service, 1200 to 1530, night service, 2200 to 0230.

⁶⁶ The service of the Sassnitz-Tralleberg Line being performed alternately by German and Swedish ferry boats, it is necessary to replace the name of the ship station in the address of radiotelegrams by one of the following indications: Ferry Boat A for the boat leaving Sassnitz in the morning; Ferry Boat B for the boat leaving Tralleberg in the morning.

Steamship accounts are settled by the N. A. Long Steamship Company, by cable, through the ferry boats of the Sassnitz-Tralleborg Line. Official correspondence with Sassnitz and Tralleborg Radio and also with other ferry boats of the Sassnitz-Tralleborg Radio Line, concerning the railway traffic.

⁶⁹ Particular correspondence relating to the service of the ship.

⁷⁰ Public correspondence is with Constanza Tunnel only.

⁷¹ The accounts for radiotelegrams sent through coast stations are settled by the Comptroller and Accountant-General, General Post Office, London; but accounts for radiotelegrams exchanged directly between ships should be sent to the office, company, etc., who operate the station.

⁷² 0800 to 1100, 1400 to 1500, 1900 to 2200; the station also listens out during the first ten minutes of each hour.

⁷³ Public correspondence restricted to urgent messages relating to navigation.

⁷⁴ Common call for submarines of O type in the Royal Marine.

⁷⁵ Common call for auxiliary ships of the Royal Marine; when necessary followed by the number or name of particular ship.

⁷⁶ Common call for minesweepers of the Royal Marine; when necessary followed by the vessel's number.

⁷⁷ Two motor lifeboats equipped with wireless telegraphy apparatus are carried by this ship.

⁷⁸ Public correspondence only with other vessels of the Zealand Co., or the coast stations Schevenique-Port and North Foreland Radio.

⁷⁹ For restricted service (see not ⁷⁸) the total charge for messages is 40 centimes per word, minimum 4 francs. For messages sent via North Foreland Radio an additional charge of 17 centimes a word, minimum 1 franc 70 centimes, is made for messages for the U.K. via North Foreland Radio, the coast station charge and the inland rate must be added.

⁸⁰ Common call sign for torpedo boats of the marine service.

⁸¹ In the case of radiotelegrams transmitted through North Foreland Radio, the coast charge is 17 centimes per word, minimum 1 franc 70 centimes. For radiotelegrams forwarded for the U.K., however, a charge is made, in addition to the ship charge, of 28 centimes per word, minimum 2 francs 80 centimes, representing the coast charge of North Foreland Radio and the inland wire charge.

⁸² In the case of radiotelegrams exchanged with coast stations of the United Kingdom the coast charge is 17 centimes per word, minimum 1 franc 70 centimes. In the case of radiotelegrams exchanged with French coast stations, the coast charge is 15 centimes per word, without a minimum.

⁸³ Public correspondence restricted to radiotelegrams exchanged by the steamers of the Zealand Company, between themselves and with the Schevenique-Port and North Foreland Radio coast stations. When, however, on special occasions, the ship departs from the normal route, the station conducts general public correspondence.

Maatschappij "Zeeland". For these messages the ship charge is 10 centimes per word, minimum 1 franc, in respect of each ship station. In the case of radiotelegrams transmitted through North Foreland Radio the coast charge is 17 centimes a word, minimum 1 franc 70 centimes. For radiotelegrams intended for the United Kingdom, however, a charge is made of 28 centimes per word, minimum 2 francs 80 centimes, representing the coast charge of North Foreland Radio and the inland wire charge.

⁸⁵ Normally corresponds only with other vessels of the Batavier Line or with the coast stations, North Foreland Radio and Schevenique-Port.

⁸⁶ This call signal applies to any or all of the submarines of the type K in the Royal Navy; it is followed when necessary by the number of a particular submarine.

⁸⁷ In the case of radiotelegrams exchanged with coast stations of the United Kingdom, the coast charge is 33 centimes per word, minimum 3 francs 30 centimes.

⁸⁸ In the case of radiotelegrams exchanged with the Tobago and Trinidad coast stations, the ship charge is reduced to 5 centimes per word with a minimum of 50 centimes, and the coast charge is reduced to 15 centimes per word, with a minimum of 1 franc 50 centimes.

⁸⁹ A motor lifeboat equipped with wireless telegraph apparatus is carried by this ship.

⁹⁰ Operated by the Compagnie Française Maritime et Coloniale de Télégraphie sans Fils, Paris, on behalf of the Marconi International Marine Communication Company, Ltd., London.

⁹¹ The ship charge is reduced to 20 centimes per word for messages exchanged with Australian and New Zealand coast and ship stations.

⁹² While engaged exclusively in Lyttleton-Wellington ferry service.

⁹³ In addition to official correspondence the station accepts private radiotelegrams for the officers and crew of the ship.

⁹⁴ Operated by Einiskipafjelag Islands, Reykjavik.

⁹⁵ When on trip to Alaska and return.

⁹⁶ When stationed in Alaskan waters.

⁹⁷ Operated by the Ship Owners' Radio Service, 149, Broadway, New York (N.Y.), through the U.S. Naval Communication Service, Navy Dept., Washington (D.C.), in the absence of special agreements.

⁹⁸ Operated by the Tropical Radio Telegraph Company, 17, Battery Place, New York (N.Y.), through the U.S. Naval Communication Service, Navy Dept., Washington (D.C.), in the absence of special agreements.

⁹⁹ Operated by the U.S. Naval Communication Service, Navy Dept., Washington (D.C.), through the U.S. Naval Communication Service, Navy Dept., Washington (D.C.), in the absence of special agreements.

¹⁰⁰ The accounts are settled by the Wireless Service Company, through the U.S. Naval Communication Navy Dept., Washington (D.C.), in the absence of special agreements.

NOTES—continued

¹⁰¹ Operated by the Federal Telegraph Company, Hobart Building, San Francisco (Cal.), through the U.S. Naval Communication Service, Navy Dept., Washington (D.C.), in the absence of special agreements.

¹⁰² The accounts are settled by the U.S. Navy, through the U.S. Naval Communication Service, Navy Dept., Washington (D.C.), in the absence of special agreements.

¹⁰³ Operated by the Independent Wireless Telegraph Company, 42, Broadway, New York (N.Y.), through the U.S. Naval Communication Service, Navy Dept., Washington (D.C.), in the absence of special agreements.

¹⁰⁴ Operated by the International Radio Telegraph Company, 326, Broadway, New York (N.Y.), through the U.S. Naval Communication Service, Navy Dept., Washington (D.C.), in the absence of special agreements.

¹⁰⁵ When carrying passengers.

¹⁰⁶ When not carrying passengers.

¹⁰⁷ The accounts are settled by the Philippine Insular Government, through the U.S. Naval Communication Service, Navy Dept., Washington (D.C.), in the absence of special agreements.

¹⁰⁸ The accounts are settled by the Vacuum Oil Company, 61, Broadway, New York (N.Y.), through the U.S. Naval Communication Service, Navy Dept., Washington (D.C.), in the absence of special agreements.

¹⁰⁹ The accounts are settled by the Tide Water Oil Company, through the U.S. Naval Communication Service, Navy Dept., Washington (D.C.), in the absence of special agreements.

¹¹⁰ The accounts are settled by the United States Steel Products Company, 30 Church St., New York (N.Y.), through the U.S. Naval Communication Service, Navy Dept., Washington (D.C.), in the absence of special agreements.

¹¹¹ When the ship is trading in the North and South American service.

¹¹² When the ship is trading in the transoceanic service.

¹¹³ Operated by the Transmarine Corporation, through the U.S. Naval Communication Service, Navy Dept., Washington (D.C.), in the absence of special agreements.

¹¹⁴ The accounts are settled by the Cutting & Washington Radio Corporation, 6-8, West 48th St., New York (N.Y.), through the U.S. Naval Communication Service, Navy Dept., Washington (D.C.), in the absence of special agreements.

¹¹⁵ The station sends daily to the Branch Hydrographic, New York City, at 0400 (time of the meridian 75° West of Greenwich), a report concerning the ice fields in the vicinity of the Grand Banks of Newfoundland. The top information is given in plain English and states the following:—*a*, ice (berg or field), *b*, date, *c*, time (meridian 75° West of Greenwich), *d*, latitude, *e*, longitude, *f*, other data as may be necessary.

¹¹⁶ This charge is reduced to 10 centimes per word when the ship is trading in the Great Lakes service.

¹¹⁷ No charge is made for relaying messages.

¹¹⁸ The relaying rate is 20 centimes per word.

¹¹⁹ When the ship is trading in the Great Lakes service.

¹²⁰ The accounts are settled by the Standard Oil Company of N.J., Incorn.

¹²¹ The accounts are settled by the Panama R.R. Company, 24, State St., New York (N.Y.), through the U.S. Naval Communication Service, Navy Dept., Washington (D.C.), in the absence of special agreements.

¹²² Transoceanic service, no rates.

¹²³ The accounts are settled by the Moore & McCormack Company, through the U.S. Naval Communication Service, Navy Dept., Washington (D.C.), in the absence of special agreements.

¹²⁴ This charge is reduced to 5 centimes when the ship is trading between East San Pedro and Avalon (Cal.).

¹²⁵ The accounts are settled by the Inland and Coastwise Waterways Service, War Dept., through the U.S. Naval Communication Service, Navy Dept., Washington (D.C.), in the absence of special agreements.

¹²⁶ The accounts are settled by the U.S. Coast Guard, through the U.S. Naval Communication Service, Navy Dept., Washington (D.C.), in the absence of special agreements.

¹²⁷ While on voyages from San Francisco to Kvichak (Alaska) and return, the station is P.G. When stationed in Alaskan waters, the ship is P.R. When P.R. the station corresponds only with the ship stations Nushagak, Kenak, Star of Holland, Star of Greenland, Star of Lapland and the land stations Decharof (Alaska), Snag Point, Clark's Point, Kvichak, Naknek KHT, Uyak (Alaska), Karuk, Altaiak, Chignik KHC, Kusliof and Pilot Point (Alaska).

¹²⁸ While on voyages from San Francisco to Kvichak (Alaska) and return, the station is N. when stationed in Alaskan waters the station is X.

¹²⁹ While on voyages from San Francisco to Kvichak (Alaska) and return, the station is P.G. When stationed in Alaskan waters, the ship is P.R. When P.R. the station corresponds only with the ship stations Kenak, Star of Holland, Star of Greenland, Star of Lapland, and the land stations Decharof (Alaska), Snag Point, Clark's Point, Kvichak, Naknek KHT, Uyak (Alaska), Karuk, Altaiak, Chignik KHC, Kusliof and Pilot Point (Alaska).

¹³⁰ The accounts are settled by the Union Oil Company, through the U.S. Naval Communication Service, Navy Dept., Washington (D.C.), in the absence of special agreements.

¹³¹ The general call signal WAAA has been assigned for all vessels operated and controlled by the Radio Corporation of America. This general call signal will be used by Radio Corporation of America, ships or coast stations desiring to ascertain whether there is an R.C.A. ship within range, and any R.C.A. vessel hearing another ship or coast station calling WAAA, should answer. Also this general call signal will be used in broadcasting messages to R.C.A. ships.

¹³² The accounts are settled by the Radio Supervisor, U.S. Shipping Board, Norfolk, Virginia.

¹³³ The accounts are settled by the U.S. Army through the U.S. Naval Communication Service, Navy Dept., Washington (D.C.), in the absence of special agreements.

¹³⁴ The accounts are settled by the United American Lines, 39, Broadway, New York (N.Y.), through the U.S. Naval Communication Service, Navy Dept., Washington (D.C.), in the absence of special agreements.

¹³⁵ The accounts are settled by the U.S. Coast and Geodetic Survey, through

CALL LETTERS

ALLOTTED TO LAND, SHIPBOARD AND AIRCRAFT STATIONS

The list of call letters of the stations, land, shipboard and aircraft of the world have been arranged alphabetically; ready reference is obtained to the class and particulars of any station by means of the indications in the third column which, if a shipboard or aircraft station, has ship or air therein, and if a land station the country in which it is situated.

HYDROGRAPHIC, METEORO- LOGICAL, TIME AND GENERAL SIGNALS

A. Meteorological.

B. Time.

C. Hydrographic.

D. General.

A.—METEOROLOGICAL SECTION.

The *International Commission of Weather Telegraphy* is the body charged with the responsibility of devising an International Code for unifying the system of collecting and distributing meteorological information by wireless. Before the war the recognised, and practically the only method of exchange of weather information, was by ordinary telegram and cable. A certain number of reports were received from ships by W/T, although these reports were by no means regular in coming to hand. The Eiffel Tower station had made some headway by issuing a weather report which included information received from a very limited number of reporting stations in Western Europe.

The nature and extent of the present arrangements for collecting and distributing this information is set out in the following pages. A tabular form has been adopted, as it seems the most suitable from the point of view of clearness and easy reference.

Meteorological information issued by W/T comes within one or more of the following headings :—

(a) *A weather report*, which is a statement of the present or existing weather conditions. This report may be either a report for a single station or, more generally, it contains information of existing weather at several stations over a comparatively large area at a certain instant of time. In the latter case it is known as a "synoptic data message." Such messages, when decoded and plotted on a map known as a *synoptic chart*, enable the observer to forecast the weather in the locality covered by the chart.

(b) *A weather forecast*, which is an opinion of future weather conditions issued by a Central Meteorological Office in possession of the information to be obtained from a synoptic chart.

Or (c) *A storm warning*, which is only broadcast when weather conditions are abnormal and shipping or aviation is thereby endangered.

Unfortunately it will be only too evident from the following pages that among the different countries issuing meteorological reports there are many departures from, or modifications of, the International Code. The problem of unifying the different forms of report bristles with difficulties owing to the variety of interests involved. Let us consider just one problem which will serve to illustrate what is meant. The situation with which the European Meteorological Services is confronted is materially different from that which presents itself to the American Services. In the one case, that of Europe, the territory within the control of each is relatively small, and it is almost imperative that an agreement should be reached to bring about a uniform method of exchange. The United States, on the other hand, is more immediately concerned with meteorological problems of a more domestic character, such as the interests of shipping about its own shores and in the Caribbean Sea, and for this purpose a word code (in contra-distinction to a numeral code) is found to be more suitable.

The past year has been a remarkable one in several ways. It has witnessed the inauguration of the first long distance continental exchange, namely, the report issued daily from the Eiffel Tower as the International Collective Report. This report contains observations from several North American stations. The exchange has certainly been of material benefit to the professional meteorologists of Western Europe in general, and our own country in particular. The "dream" of British meteorologists is now becoming a reality, as the obstacle of our own peculiar insular position is at last being overcome. For this International Collective Report enables the professional forecaster to have before him a complete synoptic chart of the North Atlantic on which he can trace the travel of depressions long

before they reach our western seaboard. In the realm of pure meteorology progress has been made with the scheme of erecting a circle of meteorological stations (equipped with wireless apparatus) around the North Pole. The chain of stations is now in process of establishment. The observatories at Spitzbergen, which have now been in existence some time, constitute the first link. The Jan Mayen station, erected during the year on the initiative of the Norwegian Meteorological Service, forms the second link. Already on several occasions wireless warnings from Jan Mayen of approaching tempests have averted much damage to Scandinavian shipping. As the circum-polar chain nears completion, pure meteorology will be enhanced by data for testing the Polar theory of Professor Bjerknes.

As to the future, progress may be expected in two directions:—

(a) By "speeding-up" the issue of reports from central stations so that a "lapse" of not more than from one and a half to two hours shall intervene between the times of observation of the various meteorological elements and their distribution by wireless. This desirable feature postulates that in the case of ships at sea reporting to a central office, a rapid and efficient service for passing the messages to shore stations and thence to the central office should be organised without delay. The needs of ships at sea in regard to weather information will march hand in hand with the requirement of aircraft. The importance of both services will therefore steadily increase.

(b) Progress may also be expected in the direction of drawing up a carefully conceived time-table of transmission times, so that the greatest possible use may be made of the existing reports, and that they may be made available for the greatest number of countries wishing to have them.

It is also to be hoped that in the next issue of the YEAR-BOOK, departures from and modifications of the International Code will be less frequent than in the pages which follow.

ABBREVIATIONS.

The following abbreviations are used throughout the section:—

- bar = barometer or barometric.
- (c) = Coastal station.
- °c = degrees centigrade.
- cw = continuous wave.
- F = Forecast.
- °F = degrees Fahrenheit.
- G.M.T. = Greenwich Mean Time.
- I = Ice report.
- (L) = Inland station.
- L.T. = local time.
- m = metres.
- mb = millibar(s).
- mm = millimetres.
- mod = modified.
- m.s.l. = mean sea level.
- N = Navigation warning.
- N.I.C. = New International Code.
- O = Ship observations from ships at sea.
- ob = observation(s) or observatory.
- O.I.C. = Old International Code.
- p.l. = plain language.
- R/T = Radio-telephony.
- S = surface observations.
- sp. = spark.
- temp. = temperature.
- T.S. = Time Signal.

- U.A.T. = Upper air temperature observations.
 U.W. = Upper air wind observations.
 U.R.S.I. = Union Radioscopique Internationale.
 W. = Storm warning.
 W.R. = Weather report.
 [] Signifies that word(s) or figure(s) printed within these brackets vary according to the time of message.
 “ ” Signifies that letters or figures contained within inverted commas are sent exactly as printed and are not coded.

CODES

THE (NEW) INTERNATIONAL CODE

I.—THE SYMBOLS AND THEIR MEANINGS.

- A = Form of *predominating cloud lowest* in the scale of cloud forms (*see* Code VI).
 a = Form of *predominating cloud highest* in the scale of cloud forms when more than one type of cloud exists (*see* Code VI).
 BBB = Pressure in millibars and tenths (initial 9 or 10 omitted), or millimetres and tenths (initial 7 omitted). The values refer to sea level and include all corrections for index error, temperature and gravity.
 BB = Pressure in whole millibars or whole millimetres (initial 9, 10 or 7 omitted). (For upper air reports of pressure, temperature and humidity, BB is in whole millibars with the hundreds figure omitted, whether this is 9, 8, 7, 6, or 5.)
 B₁B₁B₁ = Pressure in whole millibars at an “inversion of temperature” in upper air reports.
 b = Amount of barometric tendency during the three hours preceding the time of observation expressed in half-millibars or half-millimetres. For tendencies 10–19 the *second* figure only is reported and 33 is added to the wind direction number (DD). For tendencies greater than 29 the *second* figure only is reported and 67 added to the wind direction number. Tendencies greater than 29 are reported as 29.
 C = Form of predominating cloud, according to the scale of cloud forms, when only one form is reported, as from ships at sea (*see* Code VI).
 C₁ = Form of cloud observed by nephoscope; usually one of the two highest layers present (*see* Code VI).
 Ca = Form of low cloud observed by nephoscope in reports for aviation (*see* Code VI).
 c = Characteristic of barometric tendency during the period of 3 hours preceding the time of observation (*see* Code II).
 DD = Direction of the wind near the ground on the scale (01–32) in which 08 = East, 16 = South, etc., 00 = calm.
 dd = Direction of wind in the upper air, or of cloud movement, on the scale (01–36), *i.e.*, degrees from North divided by 10 and rounded off to the nearest whole number (00 = calm).
 d = Direction from which swell comes on scale (0–8), in which 2 = East, 4 = South, etc., 0 = no swell.
 d_s = Direction of movement of ship on scale (0–8), in which 2 = Eastwards, 4 = Southwards, etc.

- F = Force of the wind on the Beaufort Scale. (Forces above 9 are reported as 9 in telegrams, with the actual force in a word at the end, *e.g.*, force 10 is reported at the end as "Storm ten," force 11 as "Storm eleven." Ships at sea, however, report "gale ten," "storm eleven," "hurricane twelve.")
- F₁ = Approximate speed of low cloud (*see* Code XIV).
- GG = Greenwich Time of observation (01 = 1 a.m., 12 = noon, 13 = 1 p.m., 24 = midnight).
- H = Relative humidity of the air (*see* Code V).
- h = Height of base of lowest cloud present (*see* Code VII).
- H₁ = Heights at which upper air temperature and humidity are reported (no code figure telegraphed) (*see* Code XII).
- h₁ = Height at which upper wind is reported (*see* Code XI).
- InIn = Index number of station.
- jj = Meaning varies according to time of observation and between inland and coastal stations, as follows:—
- | | Inland.
Stations. | Coastal.
Stations. |
|----------------------|----------------------|-----------------------|
| At 0700 G.M.T. - - - | jj = mm | jj = SVs |
| At 1800 G.M.T. - - - | jj = MM | jj = SVs |
- K = The characteristic of the swell *in the open sea* (*see* Code IX (a)).
- K' = Amount and characteristic of barometric tendency expressed by a single figure (*see* Code II (a)).
- L = Amount of sky (scale 0-10) covered by cloud form A and all forms of the same layer (*i.e.*, low, medium or high) as A, if "a" refers to a different layer.
- LLL = Latitude in degrees and tenths, the tenths being obtained by dividing the number of minutes by 6 and neglecting the remainder.
- lll = Longitude in degrees and tenths, the tenths being obtained as for latitude LLL.
- MM = Maximum temperature in the interval of 11 hours ending at 18 h. G.M.T. (or at one of the hours 1 h., 7 h., 13 h., 18 h. G.M.T., following not less than 4 hours after noon, local time).
- mm = Minimum temperature in the interval of 13 hours ending at 7 h. G.M.T. (or at the hour 13 hours after the time of reporting the maximum temperature).
- N = Total amount of sky covered with cloud (scale 0-10).
- P = Day of the week. 1 = Sunday, 2 = Monday, 3 = Tuesday, 4 = Wednesday, 5 = Thursday, 6 = Friday, 7 = Saturday. The day refers to G.M.T. and not to local time, *e.g.*, Sunday means the period from 0 h. to 24 h. on Sunday at Greenwich.
- Q = Quarter of globe in which ship is situated (*see* Code XIII).
- RR = Rainfall [at 7 a.m. for preceding 13 hours and at 6 p.m. for preceding 11 hours (*see* Code VIII)].
- R = Amount of rainfall for the preceding 24 hours (*see* Code VIII (a)).
- r = Time of commencement of precipitation (*see* Code X).
- S = State of the sea and swell (coast stations) (*see* Code IX).
- TT = Temperature of the air in whole degrees Fahrenheit or Centigrade (50 added to negative values).
- tt = Temperature of the sea (surface water) in whole degrees.
- TTT = Temperature of air in degrees and tenths Fahrenheit or Centigrade (500 added to negative values).
- ttt = Temperature of the sea (surface water) in degrees and tenths.

- $t_1 t_1$ = Increase in temperature at an "inversion" in whole degrees.
 V = Visibility or distance at which objects can be seen in daylight (or at which lights can be seen at night) (see Code IV).
 v = Visibility at sea from ships at sea (see Code IV (a)).
 V_s = Visibility towards the sea (from coast stations) (see Code IV).
 VV = The relative speed of clouds as determined by nephoscope and such that the actual speed of the cloud will be given in kilometres per hour by the equation $vv = \frac{h}{1000} \times VV$, if "h," the height of the cloud, is expressed in metres. This unit is the "radian per hour."
 vv = The speed of the wind in the upper air in kilometres per hour or miles per hour.
 W = The weather in the interval since the preceding time of report. This interval is 5, 6 or 7 hours for stations reporting 4 times daily. (For special reports for aviation it is 1 hour or 2 hours) (see Code III).
 ww = The actual weather at the time of observation with which is combined, whenever possible, the general character of the weather (see Code I).
 w_1 = The initial figure of the code ww , thus indicating the general state of the weather.
 x_1 = A check figure obtained by adding the first four figures of the group and taking the units figure in the sum so obtained.
 x_2, x_3, x_4, x_5 = Check figures obtained in a similar manner.
 y_1 = A check figure obtained by adding together the first figure of each of the preceding groups, thus: $Q + P + B + F + w$, and taking the units figure of the sum.
 y_2, y_3, y_4 = Check figures obtained in a similar way from the 2nd, 3rd and 4th figures respectively.
 z = Key figure obtained by adding together all the x 's or all the y 's.

II.—SYMBOLIC FORM OF MESSAGES.

(I) REPORTS FROM LAND STATIONS.

- (a) The form for observations at 0100 and 1300 G.M.T. is—
 BBBDD FwwTT cbWVH ALaNH C₁ddVV,
 and for observations at 0700 and 1800 G.M.T.—
 BBBDD FwwTT cbWVH ALaNH RRjir C₁ddVV,
 where jj in the fifth group is replaced, as follows:—

	Inland Stations.	Coastal Stations.
at 0700 G.M.T.	mm	SV _s
at 1800 G.M.T.	MM	SV _s

The group $C_1 ddVV$, containing cloud observations by nephoscope, is omitted entirely* if no such observations are available.

(b) *Upper Winds* are reported by groups of the form $h_1 ddvv$, one group being used for each height.

(c) *Upper Air Temperatures and Humidities* are reported by groups of the form BBTTH.

In this case no figure is telegraphed to indicate the height, it being understood that the groups refer to the heights of the code H_1 in order.

Inversions are reported at the end by groups 0000 $B_1 B_1 B_1 t_1 t_1$, the first being an index group indicating that an inversion is reported, while $B_1 B_1 B_1$ is the pressure in whole millibars at the height of the inversion, and $t_1 t_1$ the increase of temperature in whole degrees.

(d) In *Collective Messages* the observations of each station are preceded by a group consisting of the index number of the station (usually two figures)

*The general rule in reports of all kinds is, however, that missing figures shall be replaced by hyphens (one for each figure).

by which it is identified. The messages are arranged in sections, the first containing the ordinary observations from *all* stations, the second, preceded by the word "Pilot" or an equivalent, containing all reports of upper wind and the third, preceded by "Temp" or an equivalent, containing all observations of upper air temperature.

Any other observations, such as those from ships, form a fourth section.

The symbolic form of a complete message, embracing surface observations at 0700 or 1800 G.M.T., upper winds and upper air temperatures and humidities, would be as follows, where the observations contained in the groups in each line, refer to the stations indicated by the index figures, I_1I_1 , I_2I_2 , etc., preceding them.

	I_1I_1	BBBDD	FwwTT	cbWVH	ALaNH	RRjJR	C _a ddVV
	I_2I_2	BBBDD	FwwTT	cbWVH	ALaNH	RRjJR	C _a ddVV.
	I_3I_3	BBBDD,	etc.,				
	etc.						
Pilot	I_1I_1	h_1 ddvv	h_1 ddvv	h_1 ddvv.			
	I_2I_2	h_1 ddvv	h_1 ddvv	h_1 ddvv.			
	I_3I_3	h_1 ddvv,	etc.				
	etc.						
	etc.						
Temp.	I_1I_1	BBTTH	BBTTH,	etc.			00000
	B_1B_1	t_1t_1 ,	etc.				
	I_2I_2	BBTTH	BBTTH,	etc.			00000
	B_1B_1	t_1t_1 ,	etc.				
	I_3I_3	BBTTH,	etc.,				
	etc.						
	etc.						

For observations at other hours the form would be the same, except that the group RRjJR would not be included.

(2) REPORTS FROM SHIPS AT SEA.

These are in the form :—

QLLL_x Plll_x BBBDD_x FvKdx₄ wwGGx₅ $y_1y_2y_3y_4z$
 { CNTTd_s WrttK' (if temperature on Fah. scale).
 { CNTTT Wrttt (if temperature on C. scale).

An alternative form for use without check figures is :—

PQLLL lllGG BBDDF wwvKd.
 { CNTTd_s WrttK' (if temperature on Fah. scale).
 { CNTTT Wrttt (if temperature on C. scale).

(Both these forms are operative at present, but a decision between the two forms is to be made by the Permanent International Meteorological Committee after consultation of the different services affected.)

(3) HOURLY REPORTS FOR AVIATION AND OTHER SPECIAL PURPOSES.

(a) The normal form for hourly reports is :—

$I_nI_n(V_s)$ wwVhL NDDEFW

with the addition, every three hours, of a group—

CaddF₁S,

where C_a is the type of cloud to which ddF₁ refer.

(b) If fuller information is required, then every three or six hours the form is—

$I_nI_n(V_s)$ BBBDD FwwTT cbWVH ALaNH CaddF₁S.

NOTE.—When, for any reason, V_s is not available, no hyphen is inserted in its place. If none of the information in the group CaddF₁S is available the whole group is omitted. In all other cases hyphens are used, in the normal way, to denote lack of information.

(4) ABBREVIATED REPORTS FOR COLLECTIVE MESSAGES COVERING A WHOLE CONTINENT.

The form of report for each station is:—

BBDDE w₁TTK'R for observations at 0700 G.M.T;BBDDE w₁TTK'W for observations at other hours.

III.—SPECIFICATION OF THE SCALES.

CODE I.

Weather at actual time of observation and general character of weather (ww).

In interpreting reports it is to be noted that, as a rule, the largest number in the scale which is appropriate to the weather is reported.)

		Code figures.
<i>Fine or Fair</i> (Cloud 0-5).	Cloud decreasing	00

7	rs ₀	rs ₀ rs ₀	rs ₀ +	rs—	rs	rsrs	rs+	RS—	RS	RSRS
8	h ₀ (r ₀)	rh ₀ rh ₀	h ₀ (r ₀)+	h(r)—	h(r)	rhrrh	h(r)+	H(R)—	H(R)	RHRH
9	tlr ₀	tlrh ₀	tlr	tlrh	TLR	TLRH	TLR 	TLRH 	KQ	KQH

A solidus (/) such as occurs in the combination "bc/r," separates weather at the time of observation from the preceding weather, bc/r thus indicates "fine or fair after rain or drizzle."

The letters have the following meanings:—

- b = fine (blue sky; not more than $\frac{1}{4}$ sky covered).
- bc = fair sky partly cloudy, $\frac{1}{2}$ covered).
- c = cloudy (sky $\frac{3}{4}$ covered).
- d = drizzle.
- f = fog.
- h = hail.
- i = intermittent (occasional).
- j = adjacent (*i.e.*, in vicinity of station).
- KQ = line squall.
- l = lightning.
- o = overcast.
- p = passing showers.
- r = rain.
- s = snow.
- t = thunder.
- tlr = thunderstorm.
- ⊕ = halo.
-  = gale.

The following additional letters are sometimes used in maps:—

- e = wet air without rain falling (a copious deposit of water on trees, buildings or rigging).
- g = gloomy.
- m = mist.
- q = squally.
- u = ugly, threatening.
- v = extreme visibility (the horizon or distant hills unusually clear).
- w = dew.
- x = hoar frost.
- y = dry air (humidity below 60 per cent.).
- z = haze (dust haze, the turbid atmosphere of dry weather).

Continuity is indicated as in the above table by repetition of letters, thus :
 rr = continuous rain. Intensity is indicated by employing capitals, thus :
 R = heavy rain and RR continuous heavy rain. A suffix ₀ means "slight,"
 thus : rs₀ = slight sleet. + means increasing and — diminishing in intensity
 or amount.

KQ = line squall (*i.e.*, very heavy squalls, with change of wind direction
 and fall of temperature).

CODE II.

*Characteristic of Barometric Tendency during the three hours preceding the
 time of observation (c).*

Code figure.		
0 = 0 or +	..	Steady or rising.
1 = + 0	..	Rising then steady.
2 = + —	..	Rising then falling.
3 = — + or 0 +	..	Falling or steady then rising.
4 = unsteady +	..	Unsteady but rising.
5 = —	..	Falling.
6 = — 0	..	Falling then steady.
7 = — +	..	Falling then rising.
8 = 0 — or + —	..	Steady or rising then falling.
9 = unsteady —	..	Unsteady but falling

The barometer is now
 higher than or the
 same as three hours
 ago.

The barometer is now
 lower than three
 hours ago.

CODE II. (a).

*Amount and Characteristic of Barometric Tendency expressed by a single
 figure (K').*

Code figure.		Change in last 3 hours in half-millibars.
0	Barometer steady.	0 or 1
1	Barometer rising slowly.	2 or 3
2	Barometer rising.	4 to 7
3	Barometer rising quickly.	8 to 12
4	Barometer rising very rapidly.	more than 12
5	Barometer falling slowly.	2 or 3
6	Barometer falling.	4 to 7
7	Barometer falling quickly.	8 to 12
8	Barometer falling very rapidly.	more than 12

CODE III.

Past Weather in interval since last report (W).

Code figure.	
0 —	Fair or fine.
1 —	Cloudy.
2 —	Overcast continuously.
3 —	Fog or mist.
4 —	Thick fog.
5 —	Passing showers.
6 —	Rain or drizzle.
7 —	Snow or sleet.
8 —	Hail or rain and hail.
9 —	Thunderstorm.

Without
 precipitation.

Precipitation.

CODE IV.
Horizontal Visibility (V) and (Vs).

Code
figure.

- 0 = Objects not visible at 50 metres (55 yards).
- 1 = Objects not visible at 200 metres (220 yards).
- 2 = Objects not visible at 500 metres (550 yards).
- 3 = Objects not visible at 1,000 metres (1,100 yards).
- 4 = Objects not visible at 2,000 metres (1½ miles).
- 5 = Objects not visible at 4,000 metres (2½ miles).
- 6 = Objects not visible at 10,000 metres (6¼ miles).
- 7 = Objects not visible at 20,000 metres (12½ miles).
- 8 = Objects not visible at 50,000 metres (31¼ miles).
- 9 = Objects visible at 50,000 metres or more.

CODE IV (a).
Horizontal Visibility from Ships at Sea (v).

Code
Figure.

- 0 = Dense fog, objects not visible at 50 yards.
- 1 = Thick fog, objects not visible at 1 cable.
- 2 = Fog, objects not visible at 2 cables.
- 3 = Moderate fog, objects not visible at ½ mile (nautical).
- 4 = Thin fog or mist, objects not visible at 1 mile (nautical).
- 5 = Visibility poor, objects not visible at 2 miles (nautical).
- 6 = Visibility moderate, objects not visible at 5 miles (nautical).
- 7 = Visibility good, objects not visible at 10 miles (nautical).
- 8 = Visibility very good, objects not visible at 30 miles (nautical).
- 9 = Visibility exceptional, objects visible more than 30 miles (nautical).

CODE V.
Relative Humidity (H).

Code
Figure.

0	95 to 100 per cent.
9	90 to 94 per cent.
8	80 to 89 per cent.
7	70 to 79 per cent.
6	60 to 69 per cent.
5	50 to 59 per cent.
4	40 to 49 per cent.
3	30 to 39 per cent.
2	20 to 29 per cent.
1	10 to 19 per cent.

CODE VI.
Cloud Form (A, a, C, C₁ Ca).

Code
Figure.

1	Cirrus	Ci.
2	Cirro-Stratus	Ci. St.
3	Cirro-Cumulus	Ci. Cu.
4	Alto-Cumulus	A. Cu.
5	Alto-Stratus	A. St.
6	Strato-Cumulus	St. Cu.
7	Nimbus	Nb.
8	Cumulus or Fracto-Cumulus	Cu. or Fr. Cu.
9	Cumulo-Nimbus	Cu. Nb.
0	Stratus or Fracto-Stratus	St. or Fr. St.

CODE VII.

Height of Base of Lowest Cloud present (h).

Code Figure.	Metres.	Feet.
0	0 to 50	0 to 150
1	50 to 100	150 to 300
2	100 to 200	300 to 600
3	200 to 300	600 to 1000
4	300 to 600	1000 to 2000
5	600 to 1000	2000 to 3000
6	1000 to 1500	3000 to 5000
7	1500 to 2000	5000 to 6500
8	2000 to 2500	6500 to 8000
9	No low cloud	No low cloud

CODE VIII.

Amount of Rainfall (RR).

This is expressed in whole millimetres with the following exceptions:—
Specification of certain meanings.

Code Figures.	Meaning.
91	0.1 mm.
92	0.2 mm.
93	0.3 mm.
94	0.4 mm.
95	0.5 mm.
96	0.6 mm.
97	Some rain but not measurable.
98	More than 90 mm.
99	Measurement impossible or unreliable.

CODE VIII (a).

Amount of Rainfall during preceding 24 hours (R).

Code Figure.	
0	No rain.
1	Trace or 0.1 mm.
2	0.2 to 2 mm.
3	3 to 5 mm.
4	6 to 10 mm.
5	11 to 15 mm.
6	16 to 20 mm.
7	21 to 30 mm.
8	31 to 50 mm.
9	above 50 mm.

CODE IX.

State of Sea and Swell (S).

Code figure.		
0	No swell	} Calm or slight sea.
1	Moderate swell	
2	Heavy swell.	} Moderate sea.
3	No swell.	
4	Moderate swell	
5	Heavy swell.	
6	Rather rough sea.	
7	Rough sea.	
8	Very rough sea.	
9	Mountainous sea.	

CODE IX (a).

Characteristic of Swell in the Open Sea (K).

Code figure.

0	No or slight swell.	} and sea smooth to moderate.
1	Moderate swell.	
2	Heavy swell.	
3	Long low swell.	
4	Confused swell.	} and sea rough.
5	No or slight swell.	
6	Moderate swell.	
7	Heavy swell.	
8	Long low swell.	
9	Confused swell.	

CODE X.

Time of Commencement of Precipitation (r).

Code figure.

0	No rain.
1	0 to 1 hour before time of observation.
2	1 to 2 hours before time of observation.
3	2 to 3 hours before time of observation.
4	3 to 4 hours before time of observation.
5	4 to 5 hours before time of observation.
6	5 to 6 hours before time of observation.
7	6 to 8 hours before time of observation.
8	8 to 10 hours before time of observation.
9	above 10 hours before time of observation.
-	No observation.

CODE XI.

Height at which Upper Wind is reported (h_1).

The heights at which the upper wind is reported are the *three* heights selected from the following list which give the best representation of the result of the pilot-balloon ascent.

Code figure.	Metres.	Feet (used in British reports).
1	200	or 1,000
2	500	or 2,000
3	1,000	or 3,000
4	1,500	or 5,000
5	2,000	or 7,000
6	3,000	or 10,000
7	4,000	or 13,000
8	5,000	or 17,000
9	6,000	or 20,000

CODE XII.

Heights at which Upper Air Temperatures and Humidity are reported (H_1) (no code figure telegraphed).

200 metres	} above ground.
500 metres	
1,000 metres	
1,500 metres	
2,000 metres	} above mean sea level.
2,500 metres	
3,000 metres	
4,000 metres	
5,000 metres	
6,000 metres	

CODE XIII.

Quarter of Globe (Q).

Code figure.	Latitude.	Longitude.	
1	N.	W.	Barometer in millibars.
2	N.	E.	
3	S.	W.	
4	S.	E.	
5	N.	W.	Barometer in millimetres.
6	N.	E.	
7	S.	W.	
8	S.	E.	

CODE XIV.

Approximate Speed of Low Cloud (F_1).

Code Figure.	Corresponding Mean Speed.		Limits of Speed.	
	If in km. per hour.	If in miles per hour.	If in km. per hour.	If in miles per hour.
0	Less than 5	Less than 5	0-7	0-4
1	15	10	8-22	5-14
2	30	20	23-37	15-24
3	45	30	38-52	25-34
4	60	40	53-67	35-44
5	75	50	68-82	45-54
6	90	60	83-97	55-64
7	105	70	98-112	65-74
8	120	80	113-127	75-84
9	135	90	128-142	85-94

THE OLD INTERNATIONAL CODE

I.—THE SYMBOLS AND THEIR MEANINGS.

BBB is the corrected barometric pressure in tenths of mm. (the first figure 7 is omitted).

DD is direction of the wind (true, not magnetic) on scale (0-32), where 02 = NNE, 04 = NE, etc. 32 = N., 0 = calm.

F is strength of the wind on Beaufort Scale (0-12) (for numbers above 9, the figure 9 is reported and actual force given in words at end).

W is state of the sky (see Code I).

TT is temperature in whole degrees centigrade. 50 is added to the number when the temperature is below zero.

C is direction of motion of upper clouds (see Code II).

β is characteristic of barometric tendency (see Code III).

bb is the amount of the tendency in tenths of mm.; 50 is added to the wind direction number (DD) if the tendency is negative.

RR is rainfall in mm., in past 24 hours (see Code VI, for special meanings).

MM is maximum temperature
mm is minimum temperature

From 7 h. of the preceding day to 7 h. of the day of observation. These are in whole degrees Centigrade, 50 being added if the temperature is below zero.

u is sea disturbance (see Code IV).

W' is characteristic of past weather sent at the end of the second group in place of C in 18 h. messages (see Code V).

(InIn is the index number of the reporting station.)

II.—SYMBOLIC FORM OF MESSAGES.

Observations at 1800 G.M.T.—BBBDD FWTTW'.

Observations at 0700 G.M.T.—BBBDD FWTT C β bbRR MMmmu.

III.—SPECIFICATION OF THE SCALES.

CODE I.

State of the Sky (W).

Code figure.

- 0 Sky cloudless.
- 1 Sky $\frac{1}{4}$ covered.
- 2 Sky $\frac{2}{4}$ covered.
- 3 Sky $\frac{3}{4}$ covered.
- 4 Sky overcast.

Code figure.

- 5 Rain.
- 6 Snow.
- 7 Mist.
- 8 Fog.
- 9 Thunderstorm.

CODE II.

Direction of Upper Cloud (Cirrus and Cirro Stratus) (C).

Code figure.

- 0 Clouds with no appreciable movement.
- 1 Clouds from N.E.
- 2 Clouds from E.
- 3 Clouds from S.E.
- 4 Clouds from S.

Code figure.

- 5 Clouds from S.W.
- 6 Clouds from W.
- 7 Clouds from N.W.
- 8 Clouds from N.
- 9 No observation.

CODE III.

Characteristic of Tendency (β).

Figures characterising the change of pressure during the 3 hours preceding the observation.

Code figure.

- 0 Barometer steady.
- 1 Barometer unsteady.
- 2 Barometer rising.
- 3 Barometer falling.
- 4 Barometer falling then rising
- 5 Barometer steady then rising.

Code figure.

- 6 Barometer steady then falling.
- 7 Barometer falling then steady.
- 8 Barometer rising then steady or falling.
- 9 Line squall.

CODE IV.

Sea Disturbance (μ).

Code figure.

- 0 Sea calm.
- 1 Sea very smooth.
- 2 Sea smooth.
- 3 Sea slight.
- 4 Sea moderate.

Code figure.

- 5 Sea rather rough.
- 6 Sea rough.
- 7 Sea high.
- 8 Sea very high.
- 9 Sea phenomenal.

CODE V.

Characteristic of past Weather (W').

Code figure.

- 0 Mainly fine.
- 1 Fair (high clouds preponderating).
- 2 Mainly overcast (low clouds preponderating).
- 3 Sheet lightning (more than one flash).
- 4 Precipitation, mainly during forenoon, without thunderstorms or with at most one peal of thunder without lightning.
- 5 Precipitation, mainly during afternoon, without thunderstorms or with at most one peal of thunder without lightning.
- 6 Mainly foggy.
- 7 Thunderstorm.
- 8 Passing showers squally changeable weather (with bright intervals).
- 9 Persistent precipitation (including falls of snow or soft hail of long duration, sky overcast during the intervals).

CODE VI.

Rainfall (RR).

The following code figures are used with a special significance.

Code figures.

- 00 No precipitation.
- 99 Precipitation has occurred but its amount has not been measured.
- 98 Precipitation exceeding 96 mm.
- 97 "Trace" of precipitation, amount less than 0.5 mm.

Amounts exceeding 96 mm. are reported in full at the end of the message, the figures 98 being inserted in the coded part.

LINDENBERG CODE FOR UPPER AIR INFORMATION

Upper Winds.—ZZWVc HHDDF HHDDF addf.

Upper Air Temperature, etc.—HHTTT PPDDF HHTTT PPDDF
.... ZZWVc.

(NOTE.—addf is a nephoscope group identified by its only containing four figures.)

The symbols have the following meanings :—

- ZZ = Hour of observations (Central European Time. Subtract one hour to get G.M.T.).
- W = Present weather in Old International Code.
- V = Horizontal visibility in New International Code.
- c = Barometric tendency (Code I below).
- HH = Height above sea level in hectometres.
- DD = Wind direction at height HH. Scale 0-32 (08 = East, etc.)
- F = Wind force at height HH. (Code II below.)
- a = Kind of upper cloud observed by nephoscope. (Code III.)
- dd = Direction from which upper cloud moves. Scale 0-32 (08 = East, etc.).
- f = Velocity-height ratio.
- TTT = Temperature at height HH in degrees and tenths Centigrade (500 added for negative values).
- PP = Percentage relative humidity (98 means 100 per cent. ; 99 means "impossible to report").

CODE I.

Barometric Tendency (c).

Code figure.

- | | | | |
|---|-----------------------------------|-------|---------------------------------|
| 0 | No appreciable variation : | | less than 0.5 mm. (in 3 hours). |
| 1 | Slow fall | | 0.5 mm. to 1.4 mm. |
| 2 | Moderate fall | | 1.5 mm. to 2.4 mm. |
| 3 | Rapid fall | | 2.5 mm. to 3.4 mm. |
| 4 | Very rapid fall | | more than 3.4 mm. |
| 5 | Slow rise.. | | 0.5 mm. to 1.4 mm. |
| 6 | Moderate rise | | 1.5 mm. to 2.4 mm. |
| 7 | Rapid rise | | 2.5 mm. to 3.4 mm. |
| 8 | Very rapid rise | | more than 3.4 mm. |
| 9 | Unsteady or impossible to report. | | |

CODE II.

Wind Speed (F).

This is expressed in metres per second.

For values 10 to 19, the number 33 is added to the figures giving wind direction DD, thus 578 means W. 18 m. per sec.

For values 20 to 29, the number 67 is added to the figures giving wind direction DD, thus 973 means NNW 23 m. per sec.

Values above 30 m. per sec. are given in words, thus:—

"976 36 sek" means NNW 36 m. per sec.

CODE III.

Upper Cloud (a).

1. Cirrus.
2. Cirro-stratus.
3. Cirro-cumulus.
4. Alto-cumulus.

EIFFEL TOWER CODE FOR UPPER WINDS

Direction of Upper Winds (D).

<i>a</i> = N.N.E.	<i>e</i> = E.S.E.	<i>i</i> = S.S.W.	<i>m</i> = W.N.W.
<i>b</i> = N.E.	<i>f</i> = S.E.	<i>j</i> = S.W.	<i>n</i> = N.W.
<i>c</i> = E.N.E.	<i>g</i> = S.S.E.	<i>k</i> = W.S.W.	<i>o</i> = N.N.W.
<i>d</i> = E.	<i>h</i> = S.	<i>l</i> = W.	<i>p</i> = N.

Speed of Upper Wind (V) in Metres per second.

<i>a</i> = 0	<i>g</i> = 12	<i>m</i> = 24	<i>s</i> = 36
<i>b</i> = 2	<i>h</i> = 14	<i>n</i> = 26	<i>t</i> = 38
<i>c</i> = 4	<i>i</i> = 16	<i>o</i> = 28	<i>u</i> = 40
<i>d</i> = 6	<i>j</i> = 18	<i>p</i> = 30	<i>v</i> = 42
<i>e</i> = 8	<i>k</i> = 20	<i>q</i> = 32	<i>w</i> = 44
<i>f</i> = 10	<i>l</i> = 22	<i>r</i> = 34	<i>y</i> = 46
			<i>z</i> = 48

AMERICAN CODE

(1).—SURFACE OBSERVATIONS (2 groups of 5 figures each).

First group of 5 figures—BBBDF.

BBB = barometric pressure in *inches* and hundredths, reduced to sea level (first figure omitted).

D = direction of surface wind.

0 = calm or no movement.

1 = N, 2 = N.E., 3 = E., 4 = S.E., 5 = S., 6 = S.W.,
7 = W., 8 = N.W.

F = force of wind on Beaufort Scale as in N.I.C. (except that forces 10, 11 and 12 are reported simply as 9 without any addition in plain language).

SECOND GROUP OF 5 FIGURES.—W¹bWAC.

W¹ = prevailing weather or state of weather at surface at time of ob.

1 = clear (3-tenths or less clouded).

2 = partly cloudy (4 to 7-tenths clouded).

- 3 = cloudy (8 to 10-tenths clouded).
- 4 = raining.
- 5 = snowing.
- 6 = thunderstorm.
- 7 = sleeting or hailing.
- 8 = dense fog.

b = pressure change in hundredths of an inch during 2 hr. preceding ob.

- 0 = change of less than 0.04 inch.
- 1 = increase of 0.04 inch.
- 2 = decrease of 0.04 inch.
- 3 = increase of 0.06 inch.
- 4 = decrease of 0.06 inch.
- 5 = increase of 0.08 inch.
- 6 = decrease of 0.08 inch.
- 7 = increase of 0.10 inch.
- 8 = decrease of 0.10 inch.
- 9 = increase or decrease of 0.12 inches or more (whether it is an increase or decrease can be determined by barometric tendency shown at surrounding stations).

W = amount of clouds—number of tenths of the sky obscured.

- 0 = 1-tenth of sky or less covered.
- 2 = 2 to 3-tenths of sky covered.
- 4 = 4 to 5-tenths of sky covered.
- 6 = 6 to 7-tenths of sky covered.
- 8 = 8 to 10-tenths of sky covered.
- 10 = total cloudiness.

A = kinds of clouds.

- 0 = 1-tenth clouds or less (kind not indicated).
- 1 = upper clouds (cirrus, cirro-stratus, cirro-cumulus, alto-cumulus, or alto-stratus), rapidity not indicated.
- 2 = strato-cumulus moving slowly.
- 3 = strato-cumulus moving rapidly.
- 4 = cumulus moving slowly.
- 5 = cumulus moving rapidly.
- 6 = stratus moving slowly.
- 7 = stratus moving rapidly.
- 8 = nimbus or cumulo-nimbus moving slowly.
- 9 = nimbus or cumulo-nimbus moving rapidly.

C = direction of cloud movement.

- 0 = no movement observable.
- 1 = north.
- 2 = north-east.
- 3 = east.
- 4 = south-east.
- 5 = south.
- 6 = south-west.
- 7 = west.
- 8 = north-west.

When both upper and lower clouds are observed, only the amount, kind, and direction of the lower clouds will be sent. In such cases the amount of the upper clouds, if any, can be determined approximately by taking the difference between the tenths of cloudiness interpreted from the figures showing "present weather" and "amount of clouds."

(2)—UPPER AIR OBSERVATIONS. $3 D_1 V_1 D_2 V_2 \quad 4 D_3 V_3 D_4 V_4$, etc.

The upper air observations are included in five groups and have identifying numbers 3 to 7, inclusive. The wind direction and force are indicated by the same numerals as for surface wind direction and force.

THIRD GROUP (upper air).—Two levels are included in this group, 250 metres and 500 metres. The first figure (3) identifies the group; the second figure indicates the wind direction at the lower elevation and the third figure the wind force at the lower elevation; the fourth and fifth

figures represent, respectively, the wind direction and force at the higher elevation.

FOURTH GROUP (upper air).—Includes 1,000 and 1,500 metre elevations; same arrangement of the five significant figures as in the third group.

FIFTH GROUP (upper air).—Includes 2,000 and 3,000 metre elevations; same arrangement of the five significant figures as in the third group.

SIXTH GROUP (upper air).—Includes 4,000 metre elevation; same arrangement, as in the third group, except that there will be only three figures in this group, followed by XX, as elevations in excess of 4,000 metres are reported only in the last group.

LAST GROUP (upper air).—Shows the highest elevation reached. The first figure (7) identifies the group as the one showing the maximum altitude, (it may be the fourth, fifth, sixth or seventh group, dependent upon the actual elevation reached); the second and third figures indicate the elevation in hundreds of metres; the fourth and fifth figures wind direction and velocity, respectively, at the indicated elevation. When the maximum elevation is 9,900 metres or more the figures 99 will be used.

INTERNATIONAL RADIOTELEGRAPHIC CONVENTION, JULY, 1912.

EXTRACT.

XIII.—METEOROLOGICAL TRANSMISSIONS, TIME SIGNALS, AND OTHER TRANSMISSIONS.

XLV.

Meteorological and other Messages.

1. The Administrations shall take the necessary steps to supply their coast stations with meteorological telegrams containing the particulars of interest to the district of such stations. These telegrams, the text of which must not exceed twenty words, shall be sent to the ships which ask for them. The charge for these meteorological telegrams shall be carried to the account of the ships to which they are addressed.

2. The meteorological observations, made by certain ships appointed for that purpose by the country to which they belong, may be sent once a day as paid service advices, to the coast stations authorised to receive them by the Administrations concerned, who shall also appoint the meteorological offices to which these observations shall be addressed by the coast station.

3. Time signals and meteorological telegrams shall be transmitted in succession one to another in such a way that the total duration of their transmission does not exceed ten minutes. In principle, while they are being sent, radiotelegraph stations, transmission by which might disturb the reception of these signals and telegrams, shall keep silent so as to allow all stations which desire to do so to receive these telegrams and signals. Exception shall be made in the case of distress calls and State telegrams.

4. The Administrations shall facilitate the communication to the marine information agencies which they may appoint of the information respecting wrecks and casualties at sea, or presenting a general interest for navigation, which the coast stations can communicate regularly.

REGULATIONS FOR THE SAFETY OF NAVIGATION.

(*Extracted from the Report of the International Conference on Safety of Life at Sea, 1914.*)

ARTICLE I.

Code for the transmission by Radiotelegraphy of Information relating to Ice, Derelicts, and Weather.

INSTRUCTIONS.

Transmission of Information.—The transmission of information concerning ice and derelicts is obligatory. This information may be sent from ship to

ship or to the Hydrographic Office, Washington, either in clear or by means of the abbreviations used in Part I of this Code.

The transmission of information relating to weather is optional. Part II of this Code may be used for this purpose, but may be modified at any time by the Meteorological Congress.

Information required :

PART I.—ICE AND DERELICTS.

1. The kind of ice or derelict observed.
2. The position of ice or derelict when last determined.

PART II.—METEOROLOGICAL INFORMATION.

1. The direction and force of the wind.
2. The set and velocity of the current.
3. Weather or state of the sky at a fixed hour.
4. Height of barometer and air temperature.
5. Barometric tendency and sea-surface temperature.

The time to be adopted :

In all radiotelegrams relating to ice or derelicts the times shall be given in Greenwich mean time.

The Address :

Reports, when sent to the Hydrographic Office, Washington, should be addressed "Hydrographic"; reports to the Meteorological Office, London, should be addressed "Meteorology."

The Message :

1. When sending information about ice or derelicts alone, two groups of five figures each are used, preceded by the word "ice"; these groups may be repeated as often as necessary.

2. If meteorological information is to be sent in addition, a further four groups of five figures each are used, preceded by the word "weather." These groups are inserted at the end of the message after all the information relating to ice has been given.

N.B.—If the message contains the word "weather," all the code groups before that word give information relating to ice, and those after the word "weather" give meteorological information. If there is no word "weather" in the message, it only contains information about ice. (See examples of the two kinds of message given in this Article.)

PART I.

ICE AND DERELICTS.

Information respecting ice and derelicts is given by means of ten figures divided into two groups of five figures each. These groups are preceded by the word "ice."

Two figures ... The day of the month (*dd*), according to Code I.

One figure ... The time of observation (*T*), according to Code II.

One figure ... The kind of ice observed (*I*), according to Code III.

Three figures ... The latitude of the ice observed (*ppp*), to tenths of a degree (*see table below*).

Three figures ... The longitude of the ice observed (*p'p'p'*), to tenths of a degree (*see table below*).

The first group consists of *ddTIp*.

The second group consists of *ppp'p'p'*.

CODES.

CODE I.—Day of the Month.

The day of the month is given by two figures, of which the first may be zero: 01 to 31.

CODE II.—Time of Observation.

The time of observation is included between—

	Code No.
1 a.m. and 4 a.m. Greenwich Mean Time	1
4 a.m. and 7 a.m.	2
7 a.m. and 10 a.m.	3
10 a.m. and 1 p.m.	4
1 p.m. and 4 p.m.	5
4 p.m. and 7 p.m.	6
7 p.m. and 10 p.m.	7
10 p.m. and 1 a.m.	8

CODE III.—Nature of Ice or Derelict Observed.

0. No ice observed.

1. Single iceberg. Huge mass of floating ice.

2. Several icebergs.

3. Numerous icebergs.

4. Floeberg. Thick piece of salt-water ice like a small iceberg.

5. Field ice. Ice extending as far as the eye can reach, but through which it is possible to navigate.

6. Pack ice. Pieces of ice broken from berg or floe, partly closed together.

7. Land ice. Ice attached to the shore since the winter.

8. Derelict.

9. (Not allotted.)

EXAMPLE.

Message sent from Ship to Ship.

—	First Message.	Coded as	Second Message.	Coded as	Third Message.	Coded as	Fourth Message.	Coded as
Date of observation	15	15	15	15	15	15	16	16
Time of observation	10 a.m.— 1 p.m.	4	4 p.m.— 7 p.m.	6	7 p.m.— 10 p.m.	7	4 a.m.— 7 a.m.	2
Nature of ice or derelict	Field	5	Numerous icebergs	3	Derelict	8	Single iceberg	1
Position of ice or derelict	Latitude 45° 42'	457	Latitude 46° 05'	461	Latitude 46° 25'	464	Latitude 47° 19'	473
	Longitude 46° 11'	462	Longitude 44° 40'	447	Longitude 43° 58'	440	Longitude 40° 15'	402

The code of the above message would thus be :

S.S. to S.S.

Ice, 15454, 57462 : 15634, 61447 : 15784, 64440 : 16214, 73402.

PART II.

METEOROLOGICAL INFORMATION.

Information respecting weather, etc., is given by four groups of five figures each. These groups are preceded by the word "weather."

First Group (DDPP) :

The day of the month : two figures (DD), according to Code I.

The position of the ship when transmitting the message.

Second Group (WWCCX) :

Wind direction and force, at 8 a.m. at the 75th meridian of west longitude : two figures (WW), according to Code V.

Set and velocity of current : two figures (CC), according to Code VI.

Weather or state of the sky at the same hour : one figure (X), according to Code VII.

Third Group (BBBA) :

The barometric height to tenths of a millimetre at 8 a.m. at the 75th meridian of west longitude : three figures (BBB), according to Code VIII.

Air temperature at the same hour : two figures (AA), according to Code IX.

Fourth Group (bbSSS) :

Barometric tendency, at 8 a.m. at the 75th meridian of west longitude : two figures (bb), according to Code X.

Sea surface temperature at the same hour : three figures (SSS), according to Code XI.

CODES.

CODE IV.—*Position of Ship.*

The position of the ship when the meteorological data given in Part II were observed.

CODE V.

Wind Direction (to 16 points, and *Wind Force*, at 8 a.m. mean time at the 75th meridian of west longitude (WW).

—	Wind Force, Beaufort Scale.	N.N.E.	N.E.	E.N.E.	E.	E.S.E.	S.E.	S.S.E.	S.	S.S.W.	S.W.	W.S.W.	W.	W.N.W.	N.W.	N.N.W.	N.

3	05	11	17	23	29	35	41	47	53	59	65	71	77	83	89	95
4	06	12	18	24	30	36	42	48	54	60	66	72	78	84	90	96
00	No current.															
99	No observation.															

N.B.—The current is to be referred to true bearings.

CODE VII.

The State of the Sky (X), at 8 a.m. mean time at the 75th meridian of west longitude :—

0. Sky quite clear.
1. Sky quarter clouded.
2. Sky half clouded.
3. Sky three-quarters clouded.
4. Sky entirely overcast.
5. Rain falling.
6. Snow or hail falling.
7. Haze or mist.
8. Fog.
9. Thunderstorm.

CODE VIII.—*Height of Barometer* (BBB).

The reading of the mercury barometer is to be corrected for index error, and reduced to 0° C. and sea level.

The corrected reading is coded by omitting the first figure of the barometer reading in tenths of a millimetre : for example, 761.2 mm. is coded as 612.

CODE IX.

Air Temperature (AA) is coded in two figures according to the following table—

Degrees Centigrade.	Degrees Fahrenheit.	Code No.	Degrees Centigrade.	Degrees Fahrenheit.	Code No.
-15.0	5.0	00	10.0	50.0	50
-14.5	5.9	01	10.5	50.9	51
-14.0	6.8	02	11.0	51.8	52
-13.5	7.7	03	11.5	52.7	53
-13.0	8.6	04	12.0	53.6	54

4.0	39.2	38	29.0	84.2	88
4.5	40.1	39	29.5	85.1	89
5.0	41.0	40	30.0	86.0	90
5.5	41.9	41	30.5	86.9	91
6.0	42.8	42	31.0	87.8	92
6.5	43.7	43	31.5	88.7	93
7.0	44.6	44	32.0	89.6	94
7.5	45.5	45	32.5	90.5	95
8.0	46.4	46	33.0	91.4	96
8.5	47.3	47	33.5	92.3	97
9.0	48.2	48	34.0	93.2	98
9.5	49.1	49	34.5	94.1	99

CODE X.—*Barometric Tendency (bb).*

By the "barometric tendency at a given hour" is meant the amount by which the barometric height has changed during the preceding three hours. It is to be expressed in millimetres. For example, the barometric tendency at 8 a.m. could be obtained by comparing the reading taken at that hour, say 755.7 mm., with a reading taken at 5 a.m., say 759.3 mm. In this case the barometric tendency would be expressed by a fall of 3.6 millimetres. As a general rule the barometric tendency is to be determined from the trace of the barograph.

The barometric tendency is coded in two figures, according to the following table:—

Rise in Barometer,		Code No.	Fall in Barometer		Code No.
Millimetres.	Inches.		Millimetres.	Inches.	
0.0—0.4	0.00—0.01	01	0.0—0.4	0.00—0.01	51
0.5—0.9	0.02—0.03	02	0.5—0.9	0.02—0.03	52

24.0—24.4	0.95—0.96	49	The barometric tendency cannot be reported.		99

CODE XI.—Sea Surface Temperature (SSS).

Sea surface temperature to tenths of a degree Centigrade, is coded by three figures, or, when necessary, by two figures preceded by zero. If the temperature is negative, the first of these three figures is 5.

For example:—

— 2.2° C. is coded as 522.

+ 1.0° C. is coded as 010.

+ 15.6° C. is coded as 156.

TABLE FOR CONVERTING MINUTES TO TENTHS OF A DEGREE.

Minutes.	Tenths of a degree.									
0-3	0
4-9	1
10-15	2
16-21	3
22-27	4
28-33	5
34-39	6
40-45	7
46-51	8
52-57	9
58-59	10

Example.

Message containing Meteorological Information.

Ice :

	First Message.	Coded as	Second Message.	Coded as
Date of observation ..	21	21	22	22
Time of observation ..	1 p.m.—4 p.m.	5	4 a.m.—7 a.m.	2
Nature of ice or derelict ..	Single iceberg.	1	Field ice	5
Position of ice or derelict {	Latitude 44° 35'	446	Latitude 42° 58'	430
	Longitude 43° 15'	432	Longitude 47° 03'	470

Weather :

—————	First Message.	Coded as	Second Message.	Coded as
Date of observation ..	21	21	22	22
Position of ship ..	Latitude 45° 13'	825	Latitude 43° 47'	863
	Longitude 42° 05'		Longitude 46° 33'	
Direction and force of wind	E.S.E. 5	26	S.W. 2	55
Set and velocity of current	N.W. 2 m-h.	82	S.S.E. 1 m-h.	39
Weather	Sky clear	0	Fog	8
Barometer	765.3 mm.	653	753.2 mm.	532
Air temperature ..	15.3° C.	61	9.8° C.	50
Barometric tendency ..	Rise .8	02	Fall 2.7	56
Sea-surface temperature ..	1.4° C.	014	— .7° C.	507

The Code of the above message sent to the Meteorological Office would thus be:—

Meteorology : Ice ; 21514, 46432 : 22254, 30470 : Weather ; 21825, 26820, 65361, 02014 : 22863, 55398, 53250, 56507.

ARTICLE II. SAFETY SIGNAL.

The radiotelegraph stations which have to transmit to ships information involving safety of navigation and being of an urgent character (icebergs, derelicts, cyclones, typhoons, sudden changes in the position or form of fixed obstructions or of land marks) shall make use of the following signal, called the safety signal, repeated at short intervals ten times at full power :
— — — (T T T).

In principle, all radiotelegraph stations receiving the safety signal shall, if the transmission of messages by them would interfere with the receipt by any other station of the safety signal and the following safety message, keep silence, in order to allow all interested stations to receive that message. This does not apply to cases of distress.

The safety message shall be transmitted one minute after the safety signal has been sent out, and shall be repeated thereafter three times at intervals of ten minutes.

The Governments of the Contracting States will select the stations which are to send out mariners safety information of an urgent character.

When the information in question has been sent out by stations performing the time service, it shall be again sent out after the transmission of the time signal and the weather report.

FORECAST CODE.

The Forecast Code is used in the Coded Forecasts for various districts in the British Isles.

Districts.—The area covered by the forecast is included in the message in each case. Normally the areas within which the different forecasts are applicable are, roughly, as follows:—

Group 111	Southern England (central part) : Dorset, Wiltshire, Berkshire, Hampshire.
Group 222	South-East England : London, Middlesex, Essex, Surrey, Sussex, Kent.
Group 333	Yorkshire, Lincolnshire, Nottinghamshire.
Group 444	South-East Scotland (places within a 50-mile radius of North Berwick).
Group 555	South-West England : Devonshire and Cornwall.
Group 666	North-West district : Lancashire, Cheshire, Shropshire and North Wales.
Group 999	England and Southern Scotland taken collectively. The forecast for this group is appended to the "General Inference" issued at 2000 G.M.T.

Form of Message.

A message in code consists of a number of five-figure groups relating to the weather, followed by further groups of five figures which are added as *check groups*. A complete decode of a specimen message is given at the end of the Forecast Code (below), from which the method of adding check groups may be understood.

In addition to the five-figure groups, words in plain English are often inserted in the message. In each group, *with the exception of check groups*, the nature of the information contained in that group is determined by the initial figure or figures, the meaning of which is as follows:—

<i>Initial figure or figures.</i>	<i>Information given where group is not a check group.</i>
09	Day of the week and hour of observations used in the message.
08	Latitude or longitude of place to which information in succeeding group or groups refers, when that place has <i>not</i> both North latitude and West longitude.
00—07 (inclusive)	Latitude and longitude of place to which information in succeeding group or groups refer when that place has both North latitude and West longitude.
1	Types of pressure distribution and changes.
2	Time and area covered by the general forecast (when used more than once in a message:—time and area to which the groups immediately following it refer).
	N.B.—The time specified may be the present. The groups can therefore be used for defining the position of a depression or anticyclone.
3	Wind direction.
4	Wind force.
50—53 (inclusive)	Wind direction and velocity.
59	Changes of wind.
6	Height table.
7	Temperature.
8	Mist, fog and visibility.
90	Cloudiness.
91	Rain, hail, snow, etc., or thunderstorms.
92	Barometric changes in past three hours.

In any case where the information corresponding with any figure cannot be given, a hyphen is inserted in place of the figure. In the computation of check figures the hyphen is counted as zero.

METHOD OF DECODING GROUPS.

Initial Figure 08.

All groups beginning with 08 occur in pairs. The first group of the pair gives the quarter of the globe (third figure) and the latitude in whole degrees (fourth and fifth figures) of the place to which the information refers—the second group of the pair gives the longitude (third, fourth and fifth figures) to the nearest whole degree.

The code for indicating the quarter of the globe (third figure of first group) is as follows:—

<i>Code Number</i>	<i>Latitude</i>	<i>Longitude</i>
1	N	W
2	N	E
3	S	W
4	S	E

Example :

08256 08004
means latitude 56° N. longitude 4 E.
08250 08014
means latitude 50° N. longitude 14 E.

(For special arrangement for the North Atlantic, see initial figure 00-07.)

Initial Figure 09.

DATE AND HOUR OF REPORT.

All groups commencing with 09 refer to the day of the week and the hour (G.M.T.) of the observations on which the report is based. The last three figures of such groups specify :

Third Figure.—Day of the week (see table below).

Fourth and Fifth Figures.—Hour of the day of the observations on which the report is based, the hours being numbered from 01 to 24 (12 noon, 24 midnight).

Example :

09418 Weather report based on observations on Wednesday at 6 p.m. (18h G.M.T.).

TABLE FOR THIRD FIGURE.

Day of Week.						Code Figure.
Sunday	1
Monday	2
Tuesday	3
Wednesday	4
Thursday	5
Friday	6
Saturday	7

Initial Figures 00 to 07, inclusive.

All groups beginning with 0 except 08 and 09 (see above) give the North latitude and West longitude of the place to which the information refers.

The second and third figures give the North latitude in whole degrees.

The fourth and fifth figures give the West longitude in whole degrees.

This group is suitable for describing positions in the Atlantic and over the extreme Western parts of Europe and North Africa and the Eastern parts of North America.

Example :

05632 means latitude 56 N. longitude 32 W.

Initial Figure 1.

Type of pressure distribution and anticipated motion thereof.

All groups commencing with 1 refer to the type of pressure distribution, and the anticipated direction of motion of the system described. The position of a depression or anticyclone is inserted immediately before this group, and may either be stated in words or be denoted by giving its latitude and longitude (by groups beginning with 00, 01, etc., up to 08), or by using the group beginning with 2. The last 4 figures of these groups specify respectively :—

Second Figure—Type of pressure distribution.

Third Figure—Changes in the nature of the system.

Fourth and Fifth Figures—Direction towards which motion is anticipated.

Second Figure.

Type of Pressure Distribution.

0—Type of pressure distribution unchanged since previous report.

1—Anticyclone off

2—Anticyclone centred over (or near)

3—Extensive anticyclone covering

4—Anticyclone wedge

- 5—Depression centred off
- 6—Depression centred over (or near)
- 7—Depression covering wide area centred over (or near)
- 8—V-shaped depression, trough over
- 9—Secondary depression (or depressions).

*Third Figure.**Changes in Nature of System.*

- 0—No important change in progress.
- 1—(a) Circulation of wind increasing in cyclone accompanied by fall of pressure near the centre.
(b) Rise of pressure in anticyclone near the centre.
- 2—(a) Circulation of wind increasing in cyclone without marked change of pressure near the centre.
(b) No marked change of pressure near the centre in anticyclone.
- 3—(a) Circulation of wind decreasing accompanied by rise of pressure near the centre.
(b) Fall of pressure near the centre in anticyclone.
- 4—(a) Circulation of wind decreasing in cyclone but no marked change of pressure near the centre.
(b) No marked change of pressure near the centre in anticyclone.
- 5—Spreading in the direction given by the last two figures in the group (without necessarily any change in the position of the centre).
- 6—Extending its influence generally.
- 7—System has appeared since last report was sent.
- 8—System not actually shown on the map but the general distribution of pressure suggests its early development.
- 9—Changes either complex or expressible by a group commencing with 92 (*see below*).

*Fourth and Fifth Figures.**Directions towards which motion is anticipated in points.*

- (08—towards East, 16—towards South, 32—towards North, etc.)
- 00—remaining stationary.
- 99—no specification of direction.

Examples :

- (1) 20046 12100—Stationary anticyclone over England, with rising barometer near its centre.
- (2) 20048 18708—V-shaped depression with trough over Ireland has appeared since last report was sent, and will move eastwards.
- (3) 20045 19812—Conditions favourable for development of secondary depressions over the British Isles moving towards the south-east.

Initial Figure 2.

TIME AND AREA COVERED BY FORECAST (OR AREA COVERED IN STATEMENT OF EXISTING CONDITIONS).

All groups commencing with figure 2, when not stating simply an area, give the time and area to which the forecast is applicable, or the time and area to which the forecast group or groups immediately following this "2" group refer; in such cases the forecast groups are themselves followed either by another "2" group, or, if they complete the message, by check groups.

The last four figures of a "2" group specify respectively:

Second and Third Figures—(1) The number of hours covered by the forecast reckoned from the hour of observation specified at the beginning of the message. *Figures 00 indicate that the following groups give a statement of conditions prevailing at that hour, and not a forecast.* (2) Figures 51-94. The time at which a change is expected to take place.

Fourth and Fifth Figures.—The area to which the forecast (or description) applies.

Second and Third Figures.
Time.

00—Statement of conditions at the fixed hour (given by group commencing 09).

01—No specification.

12—Forecast for ensuing 12 hours.

24—Forecast for ensuing 24 hours.

36—Forecast for ensuing 36 hours.

48—Forecast for ensuing 48 hours.

97—Outlook beyond period of forecast.

98—Outlook for two or three days beyond period of forecast.

Forecast for a change to take place at about the times indicated.

 97 S.E. England to N.E. France (22, 71, 62)
 98 S. England and Northern France (21-24, 69-71, 62-63)
 99 No specification.

Examples :

- 20021—Conditions prevailing at the time indicated by the first group of the message over the western part of S.E. England.
 22429—Forecast for the ensuing 24 hours for N. Wales.
 26012—After to-morrow in Belfast.

Initial Figure 3.

WIND DIRECTION.

All groups commencing with figure 3 refer to Wind Direction which is specified in points.

02—N.N.E.	18—S.S.W.
04—N.E.	20—S.W.
06—E.N.E.	22—W.S.W.
08—E.	24—W.
10—E.S.E.	26—W.N.W.
12—S.E.	28—N.W.
14—S.S.E.	30—N.N.W.
16—S.	32—N.
	00—Calm.

399. Groups commencing with 399 specify a single direction.

Example :

- 39916—Wind from South.
 39999 specifies a variable direction.

Other groups commencing with 3 specify a range of directions.

Example :

- 31624—Wind from between S. and W.

Initial Figure 4.

WIND FORCE.

All groups commencing with figure 4 refer to wind force near the surface. Wind force is specified on the Beaufort Scale.

00—Calm.	
01—Light air	1-3 m.p.h.
02—Slight breeze	4-7 m.p.h.
03—Gentle breeze	8-12 m.p.h.
04—Moderate wind	13-18 m.p.h.
05—Fresh wind	19-24 m.p.h.
06—Strong wind	25-31 m.p.h.
07—High wind	32-38 m.p.h.
08—Gale	39-46 m.p.h.
09—Strong gale	47-54 m.p.h.
10—Whole gale	55-63 m.p.h.
11—Storm	64-75 m.p.h.
12—Hurricane	Above 75 m.p.h.

499. Groups commencing with 499 specify a single force.

Example :

- 49905—Fresh wind (about 19-24 m.p.h.).

Other groups commencing with 4 specify a range of forces.

Example :

- 40405—Moderate or fresh wind (Beaufort 4 and 5).

Initial Figures 59.

CHANGES OF WIND.

All groups commencing with figures 59 refer to changes of wind. The last three figures of such groups specify respectively :—

Third Figure—Changes of direction.

Fourth Figure—Changes of force.

Fifth Figure—Character of wind, or precise change of force according to the scheme :—

Third Figure.

Changes of Direction.

- 0 No change.
- 1 Veering.
- 2 Veering about 4 points.
- 3 Veering about 8 points.
- 4 Veering 12 or 16 points.
- 5 Backing.
- 6 Backing about 4 points.
- 7 Backing about 8 points.
- 8 Backing 12 or 16 points.

Fourth Figure.

Changes of Force.

- 0 No change.
- 1 Increasing.
- 2 Increasing gradually.
- 3 Increasing temporarily.
- 4 Increasing considerably.
- 5 Decreasing.
- 6 Decreasing gradually.
- 7 Decreasing temporarily.
- 8 Decreasing considerably.

Fifth Figure.

Character of wind or force to which change will lead.

- 0 No specification.
- 1 Squally.
- 2 With heavy squalls.
- 3 Calm or light.
- 4 Moderate.
- 5 Fresh.
- 6 Strong.
- 7 High.
- 8 Gale.
- 9 Force 9 or above.

Example :

25355 59518—Wind backing and increasing to a gale this afternoon in S.W. England.

Initial Figure 5.

UPPER WIND DIRECTION AND VELOCITY.

All groups commencing with figures 50 to 53 (inclusive) specify wind direction on scale 1 to 36 (second and third figures) and wind velocity in miles per hour (last two figures). The wind is for the height specified by the following group beginning with 6, unless no such height group follows, in which case it is for a height of about 2,000 feet.

Examples :

(1) 51623—Wind from 160° velocity 23 m.p.h., at 2,000 feet (direction in degrees is obtained by multiplying the code number by 10, e.g., $16 \times 10 = 160^\circ$ in the example given, the wind therefore being from a point 160° clockwise from due North, i.e., from nearly S.S.E.).

(2) 52035 60510—Wind 35 m.p.h. from 200° between heights of 5,000 and 10,000 feet.

Initial Figure 6.

HEIGHT GROUP.

All groups commencing with 6 refer to height above sea level.

66. Groups commencing with 66 give height in hundreds of feet.

Examples :

66025—2,500 feet.

66130—13,000 feet.

Other groups commencing with 6 give a range of heights in thousands of feet, the lower height being always given first.

Examples :

60105—Between 1,000 and 5,000 feet.

60714—Between 7,000 and 14,000 feet.

Initial Figure 7.

TEMPERATURE.

All groups commencing with figure 7 refer to temperature.

70000 Temperature falling slightly.

70101 Temperature falling.

70202 Temperature falling decidedly.

70303 Temperature falling slowly.

70404 Temperature falling rapidly.

70505 Temperature falling about 5°.

70606 Temperature falling about 10°.

70707 Temperature falling to-morrow.

70808 Warm at first, temperature falling later.

72020 Temperature rising slightly.

72121 Temperature rising.

72222 Temperature rising decidedly.

72323 Temperature rising slowly.

72424 Temperature rising rapidly.

72525 Temperature rising about 5°.

72626 Temperature rising about 10°.

72727 Temperature rising to-morrow.

72828 Cold at first, temperature rising later.

74040 Temperature about normal.

74141 Moderate temperature.

74242 Little change of temperature.

74343 Temperature nearly the same day and night.

74444 Temperature very uniform.

75050 Temperature below normal.

75151 Rather cool.

75252 Rather cold.

75353 Cold night, warm day.

75454 Very cold.

- 75555 Spell of cold weather anticipated.
- 75656 Cold at night with ground frost locally, warm by day.
- 75757 Cool, ground frost locally.
- 75858 Risk of ground frost at night.
- 75959 Frost at night, temperature moderate during the day.
- 76060 Frost inland at night.
- 76161 Keen frost.
- 76262 Sharp frost at night.
- 76363 Frost day and night.
- 76464 Spell of frost anticipated.
- 76565 Indications of break up of frost.
- 76666 Slight thaw.
- 76767 Partial thaw.
- 76868 General thaw.
- 77070 Temperature above normal.
- 77171 Rather warm.
- 77272 Rather hot.
- 77373 Very warm.
- 77474 Spell of mild weather anticipated.
- 77575 Hot day.

Initial Figure 8.

MIST, FOG AND VISIBILITY.

All groups commencing with figure 8 refer to mist, fog, or visibility. The last four figures of the group specify respectively :—

Second Figure—Intensity of obscurity or degree of visibility.

Third Figure—Locality of occurrence.

Fourth Figure—Time of occurrence.

Fifth Figure —Changes in intensity.

according to the following scheme :—

Second Figure.

Intensity.

- 0 Dense fog (objects not visible at 50 yards).
- 1 Thick fog (objects visible at 50 but not at 200 yards).
- 2 Fog (objects visible at 200 but not at 500 yards).
- 3 Moderate fog (objects visible at 500 but not at 1,000 yards).
- 4 Mist or thick haze (objects visible at 1,000 but not at 2,000 yards).
- 5 Mist or haze (objects visible at 2,000 yards but not at 4,000 yards).

- 6 Slight mist or haze (objects visible at 4,000 yards but not at 4 miles).
- 7 Slight haze (objects visible at 4 miles but not at 7 miles).
- 8 Moderately good visibility (objects visible at 7 but not at 20 miles).
- 9 Good or very good visibility (objects visible at above 20 miles).

*Third Figure.**Locality.*

- 0 No specification.
- 1 Inland.
- 2 On the coast.
- 3 At sea.
- 4 On coast and at sea.
- 5 Locally (patchy).
- 6 On the hills.
- 7 In the valleys.
- 8 In the town.
- 9 Near the ground.

*Fourth Figure.**Time of Occurrence.*

- 0 No specification.
- 1 Intermittent, occasional, at times.
- 2 Persistent, or continuous.
- 3 In morning.
- 4 In afternoon.
- 5 In evening.
- 6 Morning and evening.
- 7 In the day.
- 8 At night.
- 9 Later.

*Fifth Figure.**Changes in Intensity.*

- 0 No specification.
- 1 No change anticipated.
- 2 Visibility improving 1 or 2 points.
- 3 Visibility improving 2 or 3 points.
- 4 Visibility becoming fair or good.
- 5 Clearing during the day.
- 6 Visibility deteriorating 1 or 2 points.
- 7 Visibility deteriorating 2 or 3 points.
- 8 Visibility becoming bad.
- 9 Becoming misty or foggy at night.

Example :

80920, 89600—Continuous dense fog in the valleys, good or very good visibility on the hills.

Initial Figures 90.

CLOUDINESS.

All groups commencing with 90 refer to cloudiness. The last three figures of such groups specify respectively :—

Third Figure—Amount of cloud (Weather without reference to precipitation),

Fourth Figure—Height of base of lowest cloud,

Fifth Figure—Changes in cloud amount, according to the following scheme :—

Third Figure.

Cloud Amount or Weather.

- 0 Cloudless.
- 1 Fine (cloudless or slight cloud).
- 2 Fair (about half covered).
- 3 Cloudy (more than half covered).
- 4 Mainly overcast.
- 5 Completely overcast.
- 6 Alternating cloudless and overcast periods.
- 7 Cloudless in some places, overcast in others.

Fourth Figure.

Height of base of lowest cloud.

- 0 Base of cloud below 1,000 feet.
- 1 " " 0—300 "
- 2 " " 300—600 "
- 3 " " 600—1,000 "
- 4 " " 1,000—2,000 "
- 5 " " 2,000—3,000 "
- 6 " " 3,000—5,000 "
- 7 " " 5,000—6,500 "
- 8 " " 6,500—8,000 "
- 9 " " No low cloud.

Fifth Figure.

Changes in Amount.

- 0 No specification.
- 1 Cloud increasing.
- 2 Cloud decreasing.
- 3 No conspicuous change.
- 4 Cloud developing by day, clearing at night (diurnal range).
- 5 Cloud decreasing in late afternoon.
- 6 Varying irregularly.
- 7 At first.
- 8 Later.

Example :

90097, 90598—Cloudless at first, sky becoming entirely covered by high cloud later.

Initial Figures 91.

PRECIPITATION.

All groups commencing with figures 91 refer to precipitation. The last three figures of such groups specify respectively :—

Third Figure—The form of precipitation.

Fourth Figure—The manner of its fall.

Fifth Figure—Time and Place.

according to the scheme :—

<i>Third Figure.</i>	<i>Fourth Figure.</i>
<i>Form.</i>	<i>Character.</i>
0 Precipitation.	0 Slight occasional.
1 Rain or sleet, perhaps snow.	1 Slight continuous.
2 Rain or sleet.	2 Passing showers.
3 Sleet or snow.	3 Heavy passing showers.
4 Drizzle.	4 Moderate occasional.
5 Rain.	5 Moderate continuous.
6 Snow (or snow and hail).	6 Light.
7 Sleet or rain and snow.	7 Heavy.
8 Hail or rain and hail.	8 Heavy occasional.
9 Thunderstorms.	9 No specification.

*Fifth Figure.**Distribution Time and Changes.*

- 0 Local.
- 1 General.
- 2 Frequent.
- 3 At First.
- 4 Later.
- 5 This afternoon.
- 6 To-morrow.
- 7 Decreasing in intensity.
- 8 Increasing in intensity.
- 9 No specification.

Examples :

90430, 91503—Overcast, base of cloud between 600 and 1,000 feet, occasional slight rain at first.

90097, 90358, 91974—Fine at first, cloudy, with cloud base between 2,000 and 3,000 feet and heavy thunderstorms later.

Initial Figures 92.

BAROMETRIC CHANGES.

All groups commencing with figures 92 refer to barometric change in the past three hours. The last three figures of such groups specify respectively :—

Third Figure —Characteristic of changes.

Fourth Figure—Intensity of rise or fall.

Fifth Figure —Region in which important changes are occurring, according to the scheme :—

Third Figure.
Characteristic.

0	Steady or rising.	} No change or risen in past three hours.
1	Rising, then steady.	
2	Rising, then falling.	
3	Falling or steady, then rising.	
4	Unsteady, but rising.	} Fallen in past three hours.
5	Falling.	
6	Falling, then steady.	
7	Falling, then rising.	
8	Steady or rising, then falling.	
9	Unsteady, then falling.	

Fourth Figure.
Intensity of Change.

0	Steady (tendency 0 or 1).	5	Rapid (tendency 12-10).
1	Slight (tendency 2 or 3).	6	Very rapid (tendency 13-16).
2	Moderate (tendency 4 or 5).	7	Very rapid (tendency 17-25).
3	Brisk (tendency 6 or 7).	8	Exceptional (tendency above 25).
4	Rapid (tendency 8 or 9).	9	No specification.

Fifth Figure.
Region.

- 0 Position given by latitude and longitude.*
- 1 Shetlands.
- 2 Hebrides.
- 3 West Coast of Ireland.
- 4 Scilly.
- 5 East Coast of England.
- 6 Scandinavia.
- 7 Bay of Biscay.
- 8 Iceland.
- 9 Generally.

Examples :

92833—Brisk fall of the barometer has commenced off the west coast of Ireland.

92642—Rapid fall of the barometer in the Hebrides has checked, now nearly steady.

* The position is given by the group or groups beginning with "0" preceding this barometric group. If these give a definite latitude and longitude the barometric group applies roughly to the area within a radius of 100 miles of the specified position in the case of a falling barometer.

Specimen Message, showing method of dealing with check groups :

Group 999, England and Southern Scotland, taken collectively (appended to the "General Inference" issued at 2000 G.M.T.).

09218	Baltic	16508	20042	19299	22457	22455
32024	40405	52427	90447	91501	90358	91521
91990	87000	86500	22463	32024	40304	52628
90346	91501	91521	91090	87000	86500	00800
81304	65885	97113	26885	95—	70639	

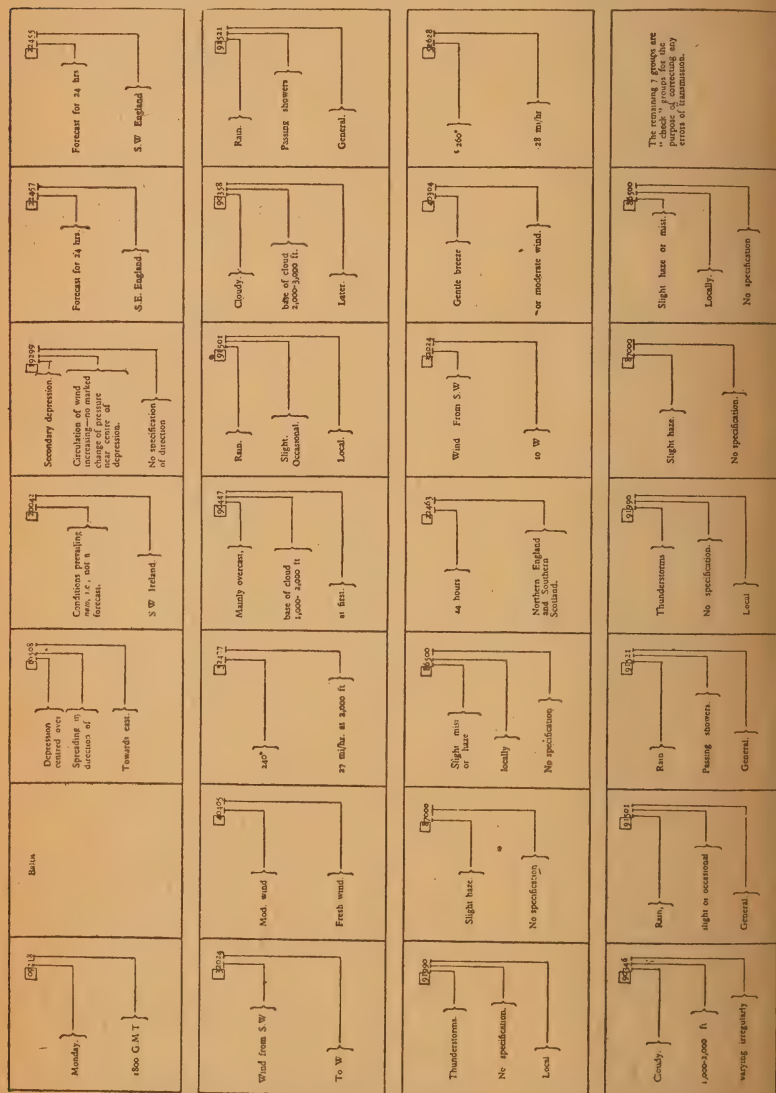

Fig. G, DECODE OF SPECIMEN MESSAGE.

CHECK GROUPS.

The following rules enable the check groups to be separated from the forecast groups on receipt of any message:—

When the total number of groups received does not exceed 6 the last 2 are check groups.
 " " " " " exceeds 6 but not 12 the last 3 are check groups.
 " " " " " exceeds 12 but not 18 the last 4 are check groups.
 " " " " " exceeds 18 but not 24 the last 5 are check groups.

The "check" groups are obtained by writing down in vertical columns the preceding groups:

(a)			(a)	
09218	0	First group of check figures.	86500	9
16508	0		22463	7
20042	8		32024	1
19299	0		40304	1
22457	0	Second group of check figures.	52628	3
22455	8		90346	2
32024	1		91501	6
40405	3		91521	8
52427	0	Third group of check figures.	91990	8
90447	4		87000	5
91501	6		86500	9
90358	5			
91521	8	(b) 70639 (5)		
91990	8			
87000	5	Seventh group of check figures.		

The figures comprising the first six check groups, are obtained by adding the horizontal columns and writing down the terminal figure of the sum thus obtained (i.e., $0+9+2+1+8=20$; check figure=0).

Similarly the seventh group is the terminal figures of each vertical column. The figure (5) of the sixth group is the "Key" figure. It is the terminal figure of the vertical column (a) of check figures and it must agree with the terminal figure obtained by adding the horizontal row (b). The key figure serves as a "check" on the check figures.

Now suppose an error of transmission (or reception) occurs in the group 19299 and instead of this, 19499 is received. The error is first detected on adding the horizontal columns, the check figure 2 not agreeing with that transmitted in the check group. Any one or more of the figures 1, 9, 4, 9, 9, might be wrong, but the error can usually be placed by adding the vertical columns and noting the disagreement with the figures of the seventh check group.

COMPLETE DECODE OF ABOVE MESSAGE.

Weather report based on observations on Monday at 6 p.m. (18h. G.M.T.). Depression over the Baltic spreading East. Secondary depression off South-West Ireland. Forecast for 24 hours for Southern England—wind between S.W. and W., moderate or fresh, 27 m.p.h. at 2,000 feet from 240° . Mainly overcast at first with lowest cloud at a height of 1,000-2,000 feet, slight occasional rain, cloudy (cloud 2,000-3,000 feet) with passing showers later perhaps thunderstorms. Visibility good but slight local haze. Forecast for 24 hours for North England and South Scotland, wind between S.W. and W., light or moderate, 28 m.p.h. from 260° at 2,000 feet. Cloudy (lowest cloud 1,000-2,000 feet) varying irregularly in amount, slight occasional local rain or passing showers perhaps thunderstorms. Visibility good but slight local haze.

SPECIFICATION OF THE BEAUFORT SCALE WITH

Beaufort Number.	Admiral Beaufort's General Description of Wind.	Admiral Beaufort's Specification, 1805.	Description of Wind.	Mode of Estimating aboard Sailing Vessels.	
0	Calm	Calm	—	—	
1	Light air ..	Just sufficient to give steerage way.	Light breeze	Sufficient wind for working ship.	
2	Slight breeze	That in which a well-conditioned man-of-war, with all sail set and "clean full," would go in smooth water from			1 to 2 knots.
3	Gentle breeze				
4	Moderate breeze	That to which she could just carry in chase "full and by."	5 to 6 knots.	Moderate breeze	Forces most advantageous for sailing with leading wind and all sail drawing.
5	Fresh breeze		Royals, etc.		
6	Strong breeze		Single-reefed topsails or top-gallant sails.		
7	Moderate gale (High Wind)	Double-reefed topsails, jib, etc.	Strong wind	Reduction of sail necessary with leading wind.	
8	Fresh gale .. (Gale)	Triple-reefed topsails, etc.			
9	Strong gale ..	Close-reefed topsails and courses.	Gale forces	Considerable reduction of sail necessary even with wind quartering.	
10	Whole gale ..	That with which she could scarcely bear close-reefed main topsail and reefed foresail.			
11	Storm ..	That which would reduce her to storm stay sails.	Storm forces	Close reefed sail running, or hove to under storm sail.	
12	Hurricane ..	That which no canvas could withstand.			Hurricane ..

* It has been decided that for statistical purposes winds of force less than 8 shall not be counted as gales, and to avoid the ambiguity implied by the use of the term "moderate gale" for force 7 the Beaufort description has been modified by the substitution of the descriptions in italics for forces 7 and 8.

EQUIVALENTS OF THE NUMBERS OF THE SCALE.

Beaufort Number.	Specification of Beaufort Scale.		Mean wind force in lb. per sq. ft. at standard density.	Equivalent velocity in miles per hour.	Limits of Velocity. Miles per hour.
	For Coast Use.	For Use on Land.			
0	Calm	Calm; smoke rises vertically.	0	0	Less than 1
1	Fishing smack* just has steerage way.	Direction of wind shown by smoke drift, but not by wind vanes.	·01	2	1-3
2	Wind fills the sails of smacks, which then move at about 1-2 miles per hour.	Wind felt on face; leaves rustle; ordinary vane moved by wind.	·08	5	4-7
3	Smacks begin to careen, and travel about 3-4 miles per hour.	Leaves and small twigs in constant motion; wind extends light flag.	·28	10	8-12
4	Good working breeze; smacks carry all canvas, with good list.	Raises dust and loose paper; small branches are moved.	·67	15	13-18
5	Smacks shorten sail ..	Small trees in leaf begin to sway; crested wavelets form on inland waters.	1·31	21	19-24
6	Smacks have double reef in main sail. Care required when fishing.	Large branches in motion; whistling heard in telegraph wires; umbrellas used with difficulty.	2·3	27	25-31
7	Smacks remain in harbour, and those at sea lie to.	Whole trees in motion; inconvenience felt when walking against wind.	3·6	35	32-38
8	All smacks make for harbour, if near.	Breaks twigs off trees; generally impedes progress.	5·4	42	39-46
9	—	Slight structural damage occurs (chimney pots and slates removed).	7·7	50	47-54
10	—	Seldom experienced inland; trees uprooted; considerable structural damage occurs.	10·5	59	55-63
11	—	Very rarely experienced; accompanied by widespread damage.	14·0	68	64-75
12	—	—	Above 17·0	Above 75	Above 75

* The fishing smack in this column may be taken as representing a trawler of average type and trim. For larger or smaller boats and for special circumstances allowance must be made.

The following table enables inches of mercury to be put into millibars and *vice versa* :—

TABLE IV.

Relation between inches and millimetres for comparison of readings of barometers graduated in these units.

In.	Mm.	In.	Mm.	In.	Mm.	In.	Mm.
27.0	685.8	28.0	711.2	29.0	736.6	30.0	762.0
27.2	690.9	28.2	716.3	29.2	741.7	30.2	767.1
27.4	696.0	28.4	721.4	29.4	746.8	30.4	772.2
27.6	701.0	28.6	726.4	29.6	751.8	30.6	777.2
27.8	706.1	28.8	731.5	29.8	756.9	30.8	782.3

NOTE.—(1) The table is based on the legal relation 1 in. = 2.5400 cm., which agrees very closely indeed with the best experimental comparisons.

(2) As millimetre barometers have the same standard temperature 0° C. for the brass scale and for the mercury, while inch barometers have a standard 32° F. for the mercury and 60° F. for the brass scale, the readings require correction for temperature by appropriate tables before the comparison can be made.

TABLE V.

OREYON							
Matare, BZE, 2,000		0135 1335	—	S.W. S.W.	The daily weather bulletin consists of two portions: the first portion referring to the Bay of Bengal, sent out from Calcutta, and the second portion relating to the Arabian Sea, sent out from Simla. The first portion is prefixed by the word "Bay," and the second portion by the words "Arabian Sea." When the weather is undisturbed the a.m. message will be a repetition of the p.m. message, while during unsettled weather the former may or may not be the same	p.l.	—
Example:—"Bay moderate storm centre sixteen north ninety east moving north-west. Arabian, sea normal."							* signifies "on request."

				STORM SIGNALS— <i>Form of message</i> :—The message is sent <i>en clair</i> . It commences with the name of the day of the week, the duration of time for which the warning is valid, followed by the word "Tempête," and the probable direction from which the gale may be expected. <i>Example of message</i> :—Jeu di 15 heures Manche tempête, N.W. Bretagne Océan tempête, S.W. Méditerranée tempête, S.W. <i>Translation</i> :—Storms or gales are predicted (or will continue) from now until 1500 to-morrow in the areas and from the directions mentioned				
						STORM SIGNALS : Wireless storm signals are broadcast at the times indicated when the forecasts show the wind to exceed 50 ft. (15m.) per sec. (Force 7 on Beaufort scale) For the purpose of these signals the coasts of France have been divided into the following areas :— "Manche" :—From the Belgian frontier to the parallel of St. Helier. "Bretagne" :—From the parallel of St. Helier to (and including) Noirmoutiers "Océan" :—From Noirmoutiers to the Spanish frontier "Roussillon" :—From the Spanish frontier to Farman "Provence" :—From (and including) Farman to the Italian frontier (including Corsica) "Méditerranée" :—This is only used when it is feasible to send one message covering the areas "Roussillon" and "Provence"

Meteorological Transmissions—Continued

FRANCE—continued.

FORECASTS FOR AGRICULTURE AND AERIAL ROUTES.

The Eiffel Tower broadcasts daily by TELEPHONY weather forecasts intended primarily for those engaged in agricultural pursuits. These reports are broadcast four times daily at 0640, 1115, 1710 and 2210 on a wavelength of 2,600 m.

(1) *Messages begin*: "Voici les prévisions agricoles de l'Office National Météorologique pour la nuit du . . . au . . . et la journée du . . ."

or "Voici les prévisions agricoles de l'Office National Météorologique pour la journée du . . ."

(2) The meteorological elements predicted are given below and are transmitted in the order indicated:—

Elements Predicted.		Given in one or more of the undermentioned terms.		Elements Predicted.		Given in one or more of the undermentioned terms.	
(a) General prevailing situation	..	e.g. temps chaud temps orageux temps froid temps pluvieux temps à averses et éclaircies temps brumeux temps neigeux		(d) Rainfall expected	..	e.g. pluies averses neiges	
(b) Wind (i) direction (i.e., direction from which winds blow) (ii) force		e.g. nord, nord-est, est, sud-est, etc. e.g. faible, modéré, fort, très fort		(e) Temperature— (i) probable minimum temperature during the night (ii) probable maximum reached during the day (iii) indication of changes		} a number } e.g. en hausse, en baisse ou stationnaire	
(c) State of the sky (amount of sky covered with cloud)		e.g. pur (none or very few clouds), nuageux (sky half covered), très nuageux (sky three-quarters covered), couvert (sky completely covered)		(f) Other information endangering crops		e.g. gelées, orages, grêles, tempêtes, brouillards	

(3) The above information is given for the following regions in the order indicated:—

"Voici les prévisions agricoles pour la région . . ."

1. *Nord*. (Aisne, Nord, Pas-de-Calais, Somme).

2. *Bretagne*. (Côtes-du-Nord, Finistère, Ille-et-Vilaine, Morbihan).

3. *Nord-Ouest*. (Calvados, Eure, Mayenne, Manche, Orne, Sarthe, Seine-Inférieure).

4. *Parisienne*. (Eure-et-Loir, Oise, Seine, Seine-et-Marne, Seine-et-Oise).

5. *Nord-est*. (Aube, Ardennes, Bas-Rhin, Haut-Rhin, Haute-Marne, Marne, Meuse, Meurthe-et-Moselle, Moselle, Vosges).

6. *Ouest*. (Charente, Charente-Inférieure, Deux-Sèvres, Indre-et-Loire, Loire-Inférieure, Maine-et-Loire, Vendée, Vienne).

7. *Centre*. (Cher, Indre, Loiret, Lot-et-Cher, Nièvre, Yonne).

8. *Est*. (Ain, Côte-d'Or, Doubs, Haute-Saône, Hautes-Alpes, Haute-Savoie, Isère, Jura, Rhône, Saône-et-Loire, Savoie).

9. *Massif Central*. (Allier, Aveyron, Cantal, Corrèze, Creuse, Haute-Loire, Haute-Vienne, Loire, Lozère, Puy-de-Dôme).

10. *Sud-Ouest*. (Ariège, Basse-Pyrénées, Dordogne, Gers, Gironde, Haute-Garonne, Hautes-Pyrénées, Landes, Lot, Lot-et-Garonne, Tarn, Tarn-et-Garonne).

11. *Sud*. (Ardèche, Aude, Cantal, Corrèze, Creuse, Haute-Loire, Haute-Vienne, Loire, Lozère, Puy-de-Dôme).

InInhd,d,v,v₁ d,d,v,v₁, etc.
(Ob. at Paris just before transmission of message) InIn wwVhL

Special N.I.C.

These give the probable changes with reference to the actual weather given in the last hourly message
They are given in plain language under four different headings, each commencing with the letters AL followed by one of the letters A, B, C or D. Thus —
After the letters ALA follows information as to state of sky, height of cloud, precipitation
After the letters ALB follows information as to wind at surface
After the letters ALC follows information as to wind at 1,000 m. (3,000 ft.)
After the letters ALD follows information as to visibility
The forecasts are given for different areas, the different parts commencing with the letters PARS

d,d₁ = direction of wind on the scale 01-32
v,v₁ = speed of wind in metres per second
The groups d,d₁v,v₁ relate to the following heights:—
500 m. 1,500 ft.
1,000 m. 3,000 ft.
1,500 m. 5,000 ft.
2,000 m. 7,000 ft.
3,000 m. 10,000 ft.
4,000 m. 13,000 ft.

K₁ = state of sea (see Eiffel Tower
synoptic)

AVIATION—GENERAL REPORTS.

The W/T stations of Cherbourg,
Brest, Lorient and Rochefort transmit
signals concerning the following
areas:—Manche, Bretagne, Océan
The W/T stations of Toulon and
Ajaccio transmit signals con-
cerning the Mediterranean area (for
details of areas see notes under Eiffel
Tower storm signals)
When the time of sending falls
outside the watch kept by ships
carrying a single operator, the message
is repeated at the commencement of
the succeeding watch

NOTES: (1) Stations regularly included are printed* in capital letters. If a regular station should be missing on any occasion a neighbouring station is inserted if available. Guernsey is only included at 0100 and 1300 G.M.T. Jersey at 0700 and 1800 G.M.T. (2) Nephusco observations (group C₁ddVV) of medium or high cloud do not always refer to the station to which the cloud group is assigned in the synoptic message, but may have been made at a neighbouring station, not included in the message, if no nephusco observations are available from the synoptic station itself. Nephusco groups are usually not given for more than 6 or 8 stations, which are normally sufficient to give a representation of the upper cloud motion over the British Isles (3) Reports received too late for inclusion in the 0800 and 1400 messages are added to the 0835 and 1435 G.M.T. hourly route messages (*q.v.*) (4) 1000 G.M.T. observations from Valencia, Plymouth and Calshot, 0700 G.M.T. observations from the Azores and additional ship reports are also added to the hourly route messages (*q.v.*) (5) At British Stations, for reports at the standard hours (0100, 0700, 1300 or 1800 G.M.T.), the figure W (past weather) always refers to the preceding period of 5, 6 or 7 hours since the last standard hour. For reports at other hours W refers to the period since the preceding report or the preceding standard hour, whichever is shorter. In the case of present weather (ww), code figures 05 to 09 and 15 to 19, the period of past weather is the last hour B₁P₂ = bar. pressure in whole mm. at 0700 cb¹/b² = characteristic of bar. tendency in half-mm. at 0100

TIME SIGNALS.

INTRODUCTION

AS the practical outcome of efforts made by the French *Bureau des Longitudes*, a time signal service was established in 1909. Signals were first transmitted twice daily by the radiotelegraphic station at the Eiffel Tower, and were primarily intended for navigation purposes. Shortly afterwards the German wireless station at Norddeich established a time service, using a different code from that employed in the Paris transmissions. The practical value of these two services in relation to navigation, having been amply demonstrated, a conference was called in 1912 to consider the whole question and to devise an International Code for transmission. Accordingly a new system was drawn up and was first employed on July 1st, 1913, by the Eiffel Tower. This system, known as the International system, is still used by this station daily at 0923 G.M.T., and by other stations in different parts of the world. The original system, generally known as the French system, is, however, still used by the Eiffel Tower daily at 1044 and 2244 G.M.T.

Most of the time signals at present transmitted are sent by means of an automatic arrangement set in motion by the pendulum of a standard clock at the local astronomical observatory. In some cases the whole of the time signal is thus automatically controlled, and in other cases part is sent by hand by an operator, and the other part (which alone can be relied upon as accurate) by a pendulum. Either of these systems give G.M.T. with an accuracy of about $\frac{1}{4}$ sec. for a practised observer, but under the most favourable conditions and by employing a self-registering method of reception, a maximum accuracy of about $\frac{1}{100}$ sec. is attainable.

There are, however, many stations in the world which are very suitably situated geographically for transmitting time signals to ships (which could not otherwise receive), where it would be difficult or impossible to establish an automatic system. In such cases signals sent entirely by hand may be provided, but the accuracy of these signals is doubtful, and must not be trusted to within one or two seconds of time. The signals are intended to enable navigators to set their chronometers while at sea at least once a day to standard G.M.T. (or prime meridian time), thus entirely eliminating errors of rate among the individual chronometers on board ship or reducing such errors to a minimum. They are of great value when approaching shore or in danger of ice, while they are of sufficient accuracy for most of the ordinary time-keeping purposes of everyday life such as regulating town and railway clocks.

It is to be hoped that wireless time signals will eventually be standardised so that there shall be only two kinds of ordinary time signals transmitted: the automatic signals being all alike and quite distinctive from those sent by hand. It is further expected that arrangements will be made for all time signals to be transmitted at times so selected that a ship with only one wireless operator on board will be able to pick up these messages.

In the following pages will be found the current arrangements for the transmission of time signals throughout the world. The International system, the old French system and the system known as the American code are set out in chart form at the beginning of the tabulated information for the sake of easy reference.

SCIENTIFIC TIME SIGNALS OR RHYTHMIC BEATS

Rhythmic signals are sent out regularly by Paris (Eiffel Tower), Lyons, Bordeaux and other stations, and consist of a series of 300 dots, each formed of a single spark, the 60th, 120th, 180th and 240th dot being suppressed in order to establish the indication for counting purposes. They are automatically transmitted by a pendulum so adjusted that it beats $\frac{49}{50}$ second intervals. These signals, when brought together for comparison with the local time apparatus, serve the purpose of a time vernier, a reading being made on beats which are coincident (or as nearly so as possible). This series of

rhythmic beats is heard at the Paris Observatory, and compared with the tickings of the Observatory standard clock.

The exact times of the 1st and 300th beats are then calculated at the Observatory to the nearest 1/100th second, and are transmitted by the Eiffel Tower station in the form of a "correction group" later the same day. The accuracy of the method depends upon the spacing and the number of coincidences. The limit of accuracy is reached when it becomes difficult to judge the coincidences. With the present system of rhythmic beats spaced at intervals of 49/50 sidereal second,* an accuracy of 1/100th second is attainable using ear methods of comparison, and with self-registering apparatus an accuracy of the order 1/1000 seconds.

PROCEDURE ADOPTED IN SENDING SCIENTIFIC OR VERNIER SIGNALS.

1. *Preliminary Tuning Signals.*—During the first minute a series of trial signals are sent thus:

• • • • • etc.

Then, for 50 seconds, a series of calls — • — • — • — • — etc., followed by 10 seconds silence.

(2) *The rhythmic beats* are sent during the next five minutes:—

A series of 300 dots are transmitted, the spacing between successive dots being one beat of a clock so adjusted as to beat 50 times in 49 seconds (Greenwich Sidereal Time) = 49/50 seconds sidereal time = 44/45 seconds mean time approximately. In this series of 300 dots the 60th, 120th, 180th and 240th dots are suppressed in order to establish the indication for counting purposes.

3. *Corrections.*—The corrected times of the first and last dots are transmitted later the same day by the Eiffel Tower Station immediately before the commencement of the ordinary semi-automatic T.S. at 1045 and 2245 (G.M.T.), as follows:—

Two groups of six figures each sent three times in succession and separated by the "break signal."

Example:

"Temps sidéral"	— • • • —	302653	351971
	— • • • —	302653	351971
	— • • • —	302653	351971
		h.	m.

Signalled time of last dot	..	10	35	19.71
" " first dot	..	10	30	26.53

Time of whole series (difference)	=	—	4	53.18
	=	293.18	seconds.	

Average interval between any two dots	=	$\frac{293.18}{299}$	sec.
	=	.9805	sec.

* A more detailed explanation of "sidereal time" will be found in *The Wireless World and Radio Review*, Jan. 13, 1922, pp. 501-504.

NOTE.—As reference is made in this section to "Sidereal Time" the following explanation may be of use to readers:—

The celestial sphere apparently revolves once per day. As all time is measured by regularly recurring phenomena, the interval between two successive returns to a fixed point of this celestial sphere is called a sidereal day. Sidereal time is reckoned from the time when the first point of the constellation Aries passes the meridian.

Our ordinary affairs, however, are regulated by the solar day, which is the interval between two successive transits of the sun's centre over the meridian. If the orbit were not inclined to the equator, and the earth throughout its orbit not in any way influenced by other planets, the intervals between the two transits would be perfectly regular.

However, for reasons which can easily be discovered by the study of astronomical text-books, the intervals between these transits are not regular, and therefore an imaginary "mean sun" is used in astronomical calculations so that the length of the conventional solar day may be kept uniform. This "mean sun" may be supposed to move with uniform velocity, completing its circuit in the same time as the real sun. When the imaginary sun is on the meridian it is the "mean noon" and when the real sun is on the meridian it is "apparent noon."

The solar day is about four minutes longer than the sidereal day for the sun appears to move eastward among the stars at the rate of about one degree a day. About March 21st the solar clock agrees with the sidereal clock, but the sidereal clock gains nearly four minutes every day. At other times there will be considerable differences between the two clocks.

It should be noted that while the sending clock is kept adjusted so as to gain about 1 second in 50, this rate may vary slightly from day to day, and consequently the interval between two dots should invariably be calculated for any particular series from the signalled times of the first and last dots. In practice it will be found better and less confusing to record the chronometer time of every other coincidence, *i.e.*, those occurring at the whole seconds, disregarding those at half-seconds. In this manner, as a rule, six coincidences in every complete series of 300 dots should be obtained at intervals of about 50 seconds apart. Also, since the rate of a chronometer may have an appreciable effect on the results (a chronometer with a rate of six seconds a day would alter its error over 0.02 second during the series of 300 dots), the most accurate value will be obtained by using the first three coincidences to obtain the mean error at the time of the first dot, the last three to obtain it at the time of the last dot, and then by taking the mean of the two errors and their corresponding times :—

(1) Chronometer time of coincidences (at whole sec.).	(2) Number of dot at which coincidences occurred.	(3) Number of intervals between first dot and coincidence.	(4) Col. 3 multiplied by 0.9805 sec.	(5) Chronometer time of first dot (<i>i.e.</i> , Col. 1 minus Col. 4).
h. m. s.			sec.	h. m. s.
10 27 28	42	41	40.201	10 26 47.799
10 28 18	94	93	91.187	10 26 46.813
10 29 10	146	145	142.173	10 26 47.827
		Number of intervals between last dot and coincidence.		Chronometer time of last dot (<i>i.e.</i> , Col. 1 plus Col. 4).
10 30 00	197	103	100.992	10 31 40.992
10 30 50	248	52	50.986	10 31 40.986
10 31 40	299	1	0.981	10 31 40.981

	First three values.	Last three values.
	h. m. s.	h. m. s.
Chronometer time of $\frac{\text{first}}{\text{last}}$ dot ..	10 26 47.48	10 31 40.99
Signalled time of $\frac{\text{first}}{\text{last}}$ dot ..	10 30 26.53	10 35 19.71
Error by $\frac{\text{first}}{\text{last}}$ three coincidences	— 3 39.05	— 3 38.72

Mean error .. = — 3 38.89

Chronometer is 3 m. 38.89 s. slow on signalled time.

The times given above are Greenwich Sidereal Time; for converting these values to G.M.T. see tables on following pages:

The Table gives the Equivalent Mean Intervals							
The Sum is the Mean Time required, January 20th				2 25 18.96			

* From Nautical Almanack.

STANDARD TIMES.

The following Standard Times, referred to the Meridian of Greenwich, have been adopted for railway and other purposes:—

h. m.	
11 30 E.	New Zealand.
11 0 E.	New Caledonia.
10 0 E.	Tasmania, Victoria, New South Wales, Queensland, New Guinea.
9 30 E.	South Australia.
9 0 E.	Japan, Korea.
8 0 E.	Western Australia, Portuguese Timor, British North Borneo, Philippine Islands, Macao, Hong Kong, China (Coast), Formosa.
7 0 E.	Straits Settlements, Federated Malay States, French Indo-China.
6 30 E.	Burma.
5 30 E.	India.
5 0 E.	Chagos Archipelago, Portuguese India.
4 0 E.	Mauritius, Seychelles.
3 0 E.	Somaliland, Madagascar.
2 30 E.	East African Protectorate.
2 0 E.	(East Europe).—Roumania, Bulgaria, Turkey, Greece. Egypt, Portuguese East Africa, South Africa.
1 0 E.	(Mid-Europe).—Germany, Luxembourg, Denmark, Sweden, Norway, Switzerland, Italy, Austria-Hungary, Bosnia, Servia, Malta, Portuguese West Africa, South-West Africa, Nigeria.
0 0	(Greenwich).—Great Britain, Ireland, France, Belgium, Spain, Portugal, Gibraltar, Algeria, Farøe Islands.
1 0 W.	Iceland, Madeira, Portuguese Guinea, Sierra Leone.
2 0 W.	Azores and Cape Verde Islands.
3 0 W.	Eastern Brazil.
4 0 W.	(Atlantic).—Part of Canada, Leeward Islands, Central Brazil, Chile.
5 0 W.	(Eastern).—Parts of Canada and United States, Western Brazil, Peru, Panama, Jamaica, Bahamas.
6 0 W.	(Central).—Parts of Canada and United States, Honduras.
7 0 W.	(Mountain).—Parts of Canada and United States.
8 0 W.	(Pacific).—British Columbia and Part of United States.
9 0 W.	Yukon, Alaska.
10 30 W.	Sandwich Islands.
11 30 W.	Samoa.

REGULATIONS FOR THE SAFETY OF NAVIGATION.

SAFETY SIGNAL.—The radiotelegraph stations which have to transmit to ships information involving safety of navigation and being of an urgent character (icebergs, derelicts, typhoons, cyclones, sudden changes in the position or form of fixed obstructions or of land marks) shall make use of the following signal, called the safety signal, repeated at short intervals ten times at full power: — — — (T T T). In principle, all radiotelegraph stations receiving the safety signal shall, if the transmission of messages by them would interfere with the receipt by any other station of the safety signal and the following safety message, keep silence, in order to allow all interested stations to receive that message. This does not apply to cases of distress. The safety message shall be transmitted one minute after the safety signal has been sent out, and shall be repeated thereafter three times at intervals of ten minutes. The Governments of the Contracting States will select the stations which are to send out to mariners safety information of an urgent character. When the information in question has been sent out by stations performing the time service, it shall be again sent out after the transmission of the time signal and the weather report.

Country, Station, Call, Wavelength.	Time G.M.T.	Area covered by message.	Codes.	Notes.
ALASKA Dutch Harbour, N.P.R., 600 sp. Juneau, NVD, 600 ..	0100 0500 1700 2100	—	Information concerning wrecks, derelicts, ice and other dangerous obstructions to navigation as received from the Hydrographic Office, Washington, or from a branch hydrographic office or other reliable source	Messages broadcast at times stated Naval W/T stations will furnish this information whenever practicable, to passing vessels on request,
ALGERIA Oran, FVO 1,350 ..	1800	—	—	The warning message will be repeated daily for a week if necessary
BELGIUM Ostende, OST, 600 ..	0800 1600	—	Messages preceded by the danger call (T T T) repeated at short intervals, 10 times on full power (As Ostende above)	Warnings are repeated three times at intervals of 10 minutes
Antwerp, OSA, 600 ..	0700 1500	—	do. do.

REPORTING DERELICTS AND VESSELS IN DISTRESS
It frequently happens that masters of vessels, when sighting derelicts or vessels in distress, and in reporting them by radio, fail to observe and report essential data as to the condition of the craft, necessary before a search is begun by a United States Coastguard cutter. In consequence of this neglect it frequently becomes necessary for the searching cutter to send radiograms in an effort to obtain the necessary information. To be complete, information concerning a derelict should state:

- The general condition of the vessel
- Whether bottom up or awash
- Height of hull above water and any abnormal conditions as to buoyancy
- As to whether masts are standing, sails set, or otherwise
- Force and direction of wind
- Any observed current, its set and strength

Similar descriptive information should also be furnished of vessels in distress. This information is necessary in order to determine roughly the direction and speed of drift of the derelict or vessel, and also to give an idea of the appearance of the object sought.

All the U.S. Naval W/T stations mentioned in the foregoing schedule are open at all times to receive reports concerning hydrographic information from masters of vessels. The messages are to be endorsed "Govt. Hydro," and transmitted in plain language direct to the W/T station which disseminates

This message is sent three times, with intervals of two minutes between each

In preparing information for transmission, it is desired that messages be concise as consistent with exactness and clearness. The order of the message will be in the order of the importance of the items. To promote uniformity the following order of subjects is recommended:—

- Derelicts and sunken wrecks.
- Mines.
- Ice.
- Aids to navigation adrift.
- Floating rafts, logs, wreckage.
- Misplaced buoys in approaches to harbours.
- Other items considered sufficiently important to broadcast.

Note.—Vessels in the Caribbean Sea and West Indian waters north of the parallel of lat. 15° 00' N. should report to any of the under-mentioned W/T stations, which will transmit the information, via West Key, to Savannah and New Orleans W/T stations:—

Country.	Name of W/T station.	Call Signal.
Virgin Islands	St. Thomas	NBB
Porto Rico	San Juan	NAU
Cuba	Guantanamo	NAW

Broadcasts all information relating to ice and its movement in the North Atlantic, which is received from the United States Coastguard Cutter on the Ice Patrol

These stations will also transmit the latest information concerning ice to any ship upon request

UNION RADIO SCIENTIFIQUE INTERNATIONALE

U.R.S.I. Signals

Amongst the decisions arrived at by the International Conference on Radio Communications held in Paris during June, July and August, 1921, was the necessity for the transmission by a number of transmitting stations, of scientific signals for the purpose of observations relating to the *law of the propagation of energy*.

The *law of the propagation of energy* has not yet been established on a completely and rigorously scientific basis. The study of this question covers the choice of the most convenient analytical formula, the determination of its constants, the examination of the continuous variations that the phenomenon of propagation undergoes and of the causes which produce them, the definition of the methods suitable for the measurement of the very feeble reception currents and of the electromagnetic fields produced, the establishment of the direction along which the propagation of energy takes place, etc. In order to commence the attack upon the problems it has been proposed by the Paris Conference that a certain number of transmitting stations should execute at suitable hours some particular transmissions of which the wavelength (or frequency) and the intensity of the current in the antenna should be accurately measured. A certain number of observers, distributed in the receiving stations of different countries, should record the intensity of these signals, or better, that of the corresponding electromagnetic field and possibly also the direction of propagation.

The signals, to be transmitted under the direction of the Union Radio-Scientifique Internationale (U.R.S.I.), should last three full minutes; the first minute serving for the regulation of the receiving apparatus and consisting of the repeated emission of a signal composed as follows:—

“URSI of (name of the station)—(wavelength in metres of the emission made the day before)—(intensity of current in amperes during that same emission)” as, for example, “URSI of XY—18,500—230.” The succeeding two minutes should be occupied in the emission of a long dash. There should then be sent to the Central Bureau (at Brussels) the schedules of each transmitting station containing the largest possible amount of technical data upon the emissions carried out, on the antenna, on the apparatus, on the meteorological conditions, etc. Analogous data should be despatched also by the stations that send out signals at regular times because they also are able to serve for measurements of intensity of reception. All this data should be rapidly co-ordinated by the Central Bureau, and should be printed and distributed widely to those interested. Similarly, receiving stations should record all relative data for the purpose of co-ordination of results.

The study of atmospheric disturbances and research in the direction of their elimination is probably one of the most important subjects in connection with wireless telegraphy at the present day.

Since February 1st 1922, the following French stations have transmitted U.R.S.I. signals. The transmissions are made *daily* at the times indicated below:—

(1) *Eiffel Tower (FL)*

Station particulars:

Latitude	48° 48' N.
Longitude	2° 15' E.
Effective height of aerial	85 metres

Spark transmission :—

(1) Wavelength	2,600 metres
(2) Frequency*	115.300 K.C.
Intensity of current in aerial	85 A.
Energy in aerial	55 k.W.
Resistance of aerial	7.6 Ω.

Procedure.

At 1034 G.M.T.	U.R.S.I. de FL . . . U.R.S.I. . . . (exact wavelength and energy in aerial of previous day's transmission).
At 1036 G.M.T.	Two minutes dash.
At 1038 G.M.T.	Preparatory signals preceding the ordinary semi - automatic T.S. of 1045.

(2) *Bordeaux (La Fayette).* (L.Y).

Station Particulars :—

Latitude	44° 42' N.
Longitude	0° 48' W.
Effective height of aerial	170 metres
Poulson arc transmission :—		
(1) Wavelength	23,450 metres
(2) Frequency*	12.800 K.C.
Intensity of current in aerial	480 A.
Energy in aerial	300 k.W.
Total resistance of aerial	1.17 Ω.

Procedure.

At 1955 G.M.T.	URSI de LY . . . URSI de LY . . . (Exact wavelength and energy in aerial of previous day's transmission).
At 1956 G.M.T.	Two minutes dash.
At 1958 G.M.T.	Preparatory signals preceding the scientific T.S. (rhythmic beats) of 2000.

(3) *Nantes.* (UA).

Station particulars :—

Poulson arc transmission wavelength . . 9,000 metres.

Procedure.

At 1415 G.M.T.	URSI de UA . . . URSI de UA . . . (Exact wavelength and energy in aerial of previous day's transmission).
At 1416 G.M.T.	Two minutes dash.

NOTE.—In the absence of accurate information as to the exact wavelength and energy in aerial of the transmissions of the previous day, a series of the letter "x" will be transmitted in place of these figures.

CALIBRATED WAVES.

Transmission of calibrated waves is made by the undermentioned stations :—

- (1) *Eiffel Tower* (FL) on the 1st and 15th days of each month.

Calibration wave = 5,000 metres.

Procedure : C.W. transmission (energy in aerial about 60 kw.).

From 1800-1801 (G.M.T.) • — • — • — • — • — etc.

At 1801 (G.M.T.) three-minute dash (5,000m. wave).

* Frequency is expressed in "kilo-cycles" (K.C.), this term denoting "thousands" of complete cycles per sec." The formula connecting wavelength and frequency is :—

$$\text{Wave (in metres)} = \frac{3 \times 10^8}{\text{K.C.}}$$

Calibration wave = 7,000 metres.

From 1810-1811 (G.M.T.) — . . . — . . . — . . .
etc.

At 1811 (G.M.T.) three-minute dash (7,000 m. wave).

It is impossible to ensure the transmission of rigorously exact wavelengths. Very precise measures of the waves as they are received are made in the laboratories of the "Invalides" at Paris, and the corrections to be applied are thus determined. The station at Lyons (see below) transmits the exact length of these waves at 1900 G.M.T.

(2) Lyons (YN) on the 1st and 15th days of each month.

Calibration wave = 10,000 metres.

Procedure: C.W. transmission (energy in aerial about 100 kw.).

From 1820-1821 (G.M.T.) — . — . — . — . — .
etc.

At 1821 (G.M.T.) three-minute dash (10,000m. wave).

Calibration wave = 15,000 metres.

From 1830-1831 (G.M.T.) — . . — . . — . . , etc.

At 1831 (G.M.T.) three-minute dash (15,000m. wave.)

TRANSMISSION OF CORRECTED VALUES FOR THE FOUR WAVES ABOVE (i.e., 5,000, 7,000, 10,000 and 15,000 metres).

Procedure: At 1900 (G.M.T.) a series — . — . — . , followed by — . — . — . — . (C.Q.) — . . . — (a group of figures giving the exact wavelength of first wave, approximately 5,000 m.); (a group approximately 7,000); (a group approximately 10,000); (a group approximately 15,000). The whole message is sent three times in succession.

The Air Ministry (GFA) transmits a series of calibrated waves daily at times shown.

Time G.M.T.	Wave- length C.W.	Call Signs.	Signal.	Correction.
0745	1400	CQV GFA	A series of figures 1 (. — — — —) for 30 sec., fol- lowed by a single dash (—) lasting 5 sec.	Immediately following the 5 sec. dash any necessary correction will be transmitted as follows:—
0800	1680	CQV GFA	A series of figures 2 (. . — — —) for 30 sec., fol- lowed by a single dash (—) lasting 5 sec.	Indicating figure for the wave (i.e., "1," "2," B.T., followed by a 4-figure group, indi- cating the actual wave- length transmitted.
0750	900	CQV GFA	A series of figures 3 (. . . — —) for 30 sec., fol- lowed by a single dash (—) lasting 5 sec.	If no correction is nec- essary, VA will be made after the 5 sec. dash.

A List of Calibrated Waves sent out by various stations is contained in the Regular Transmissions of Wireless Stations in the Amateur and Experimental Section.

TRANSMISSION OF EARTHQUAKE NEWS BY W/T.

Seismological Radiotelegrams.

It seldom happens that rapid communication of seismological observations is seriously needed, because the accurate location of an epicentre is best undertaken when all the information relating thereto is available. At present the role of W/T is that of providing a means of roughly checking the reliability of information in a report, which, from the records of local instruments, appears to be misleading.

(1) Details of Seismological reports transmitted by the Eiffel Tower (FL).

These reports give information regarding earthquake disturbances registered by the seismographs at the Geophysical Observatory at Strasbourg, or transmitted thereto by any of the co-operating seismological observatories at Algiers, Athens, Barcelona, Brussels, Coimbre, Oxford, Paris, Rome, Zurich and Wei-hai-Wei (China).

The messages are sent when necessary either (a) after the 1920 G.M.T. Synoptic Weather Report, or (b) at the end of the 1905 G.M.T. International Collective Report. Transmission is made on a wavelength of 2,600 metres (musical spark), and the energy in the aerial is approximately 60 kw.

Form of Message.

There are three forms of report varying with the nature and extent of the disturbance :—

- (a) Reports giving information regarding slight movements of the earth's crust or quakes of very feeble intensity. These reports are preceded by the words "Sismo Strasbourg," followed by a message *en clair* (in French) giving the particulars.

Example : "Sismo Strasbourg" le 28 mai, longues ondes vers 20h. 12m., maximum NS, 20h. 26m. Séisme lointain 21h. 05m., 46s. ; maximum 21h. 44m.

- (b) The message also frequently gives particulars of micro-seismic disturbances. These minute disturbances may be due to the passage of atmospheric depressions over the land or the breaking of waves against the cliffs or a combination of the two causes. Reports from other French observatories are often included.

Example : "Sismo Strasbourg" du 6 ou 7 juin, agitation croît légèrement. Briançon signale secousse du degré 4, durée 2 secondes à 8h. 20m.

- (c) Important earthquake disturbances are transmitted in the following code :—

ddaaap phhmm ssttt D₁D₁DDD.

where the symbols have the following meanings :—

dd = day of month.

aa = azimuth of epicentre from 10° to 10° counting from N through E (01-36), based on any *clair* indications of the trace on the seismograph(s). The addition of 50 (*i.e.*, figures 51-86) indicates that the azimuth is uncertain by $\pm 180^\circ$. The figures 91-98 are used to indicate that the direction is vague and estimated only to the nearest 45°; 99 means that no azimuth determination has yet been made; 00 that it seems impossible.

pp = refer to phases, P being the primary wave (code figures 1-4) and S the secondary wave (code figures 5 to 8).

	1	2	3	4
Phase P	iP very clear trace of P waves.	P and \bar{P} clear	P clear	eP beginning badly defined on trace.
	5	6	7	8
Phase S	iS very clear trace of S waves	S clear	eS beginning badly defined on trace	uncertain

For disturbances near at hand (*i.e.*, when the epicentre is less than 700 km. distant), waves represented by the symbol \bar{P} are noted. These waves travel in a different layer of the earth's crust from P waves and less rapidly. The figure 9 for either P or S indicates that the minute signal interferes with the beginning (the pen which makes the trace on the recording ribbon being out of contact at this moment).

hh, mm, ss are the hours minutes and seconds of the beginning of P.
ttt is the difference in seconds of the times of arrival of the S and P waves, *i.e.* (S-P) in sec.

D_1D_1 is the difference ($\bar{P} - P$) in seconds for close earthquakes ; if this difference is not clear on the trace, D_1D_1 is replaced by 99.

DDD is the distance in kilometres for close earthquakes.

D_1D_1DDD is the distance in kilometres for distant quakes.

NOTE.—The region of the epicentre is given *en clair* whenever possible together with an indication of the intensity of the disturbance.

Example :—2099I 5005I 33393 04830 Turkestan.

Translation : Disturbance on the 20th, azimuth of epicentre not yet determined, iP, iS beginning at oh, 51m. 33s., difference S-P = 393 sec. ; distance 4,830 km. ; epicentre Turkestan.

(2) Reports transmitted by Bordeaux (LY).

Important seismological radio-telegrams (*i.e.*, those in code (c) above) are repeated by Bordeaux on a wavelength of 23,450 m. CW., at the conclusion of the scientific T.S. (rhythmic beats) at 2,000 G.M.T.

AIRCRAFT.

Information with regard to Distress Signals by Day and Night.

Mariners and others are notified that when any aircraft is in distress and requires assistance, the following shall be the signals displayed by her, either together or separately :—

- I. The International Signal "S.O.S." by means of visual or Wireless Telegraphy.
- II. The International Code Signal of Distress indicated by N.C.
- III. The Distant Signal consisting of a square flag having above or below it a ball or anything resembling a ball.

IV. A continuous sounding with any sound apparatus.

V. A signal consisting of a succession of White Very's lights, fired at short intervals.

VI. A white flare from which at intervals of about 3 seconds a white light is ejected into the air.

Note.—The above signals are subject to such modification as shall be published from time to time.

Wireless Navigational warnings to Airmen.

Information of a specially urgent nature concerning aerial navigation *e.g.*, warning regarding the discontinuation of navigational aids or obstruction of landing areas at aerodromes, will be broadcast by W/T from the Air Ministry Station (GFA), in addition to being promulgated in the usual manner. Such notices issued by W/T will be added at the end of the Air Ministry synoptic weather reports transmitted on a wavelength of 4,100 m. C.W. at any of the following times (G.M.T.) daily :—

0600, 0800, 1400, 1900.

FOG SIGNALS.

SPAIN, NORTH-WEST COAST.

Cape Finisterre and Cape Villano—W/T Fog Signals

(1) Cape Finisterre lighthouse : (Lat. $42^{\circ} 53' N.$, long. $9^{\circ} 16' W.$ (*approx.*)).

Wireless fog signals on a wavelength of 1,000 metres are transmitted continuously during thick or foggy weather. The signals consist of a note tuned to 500 vibrations per second, of 0.5 second duration *every* $7\frac{1}{2}$ seconds, thus :—

Sound,	silent interval,
0.5 sec.	7.0 sec.

making in all 8 emissions per minute.

Range of signals.—30 moles.

(2) Cape Villano lighthouse : (Lat. $43^{\circ} 10' N.$, long. $9^{\circ} 13' W.$ (*approx.*)).

Wireless fog signals on a wavelength of 1,000 metres are transmitted continuously during thick or foggy weather. The signals consist of a group of sounds on a note tuned to 600 vibrations per second, *every* 30 seconds, thus :—

Sound,	silent interval,	sound,	silent interval,
1.0 sec.	7.0 sec.	1.0 sec.	21.0 sec.

Range of signals.—30 miles.

UNITED STATES, PACIFIC COAST—CALIFORNIA.

San Francisco Light Vessel—W/T Fog-Signals.

Position.—San Francisco light vessel, lat. $37^{\circ} 45' N.$, long. $122^{\circ} 42' W.$ (*approx.*).

Call signal.—NAKS.

Wavelength.—1,000 metres.

Wireless fog signals are operated daily from 1700 to 1730 and from 2300 to 2330 G.M.T. ; and continuously during thick or foggy weather.

The signals consist of a series of *double dashes every minute*, thus:—

(— — — — — c.), Silent interval,
30 seconds. 30 seconds.

Note.—Vessels equipped with direction finding apparatus can determine their bearing from the light vessel by the above signal.

FREE MEDICAL ADVICE TO SEAMEN BY W/T.

United States-Atlantic and Pacific Coasts.

Through the co-operation of the Seamen's Church Institute of New York with the United States Public Health Service, free medical advice for ships at sea is now available through the undermentioned coast W/T stations on the Atlantic and Pacific coasts of the United States, belonging to the Radio Corporation of America. The names of the hospitals furnishing the service are also designated:—

W/T Stations.	Call Signal.	Position. — Latitude. Longitude.	Hospitals.
Chatham, Mass. ...	WCC	41° 43' N. 70° 46' W.	U.S. Marine Hospital No. 70, 67, Hudson Street, New York. (Alternatively: Hospitals Nos. 38, 43 and 61.)
Siasconset, Mass. ...	WSC	41° 17' N. 69° 58' W.	
New York City ..	WNY	49° 39' N. 74° 00' W.	
Cape May, N.J. ...	WCY	38° 56' N. 74° 56' W.	U.S. Veterans' Hospital No. 49, Gray's Ferry Rd., and Twenty fourth St., Philadelphia. (Alternatively: U.S. Veterans' Hospital No. 56, Baltimore.)
San Francisco (Bolinas)	KPH	37° 54' N. 122° 42' W.	U.S. Marine Hospital No. 19, Fourteenth Avenue and Lake St., San Francisco. (Alternatively: U.S. Veterans' Hospital No. 24, Palo Alto, California.)

Ships desiring medical advice can secure prompt service by communicating with any of the above mentioned W/T stations. The message is to be signed by the master of the vessel, and should state briefly the symptoms of the person afflicted.

The reply containing the medical advice given by the hospital consulted will be sent in plain language (English) and so phrased as to be intelligible to a layman.

This free medical service has been established primarily for the benefit of ships not carrying physicians; however, should occasion arise, wireless consultation may be held by ships' physicians with the hospital staffs through the W/T stations referred to.

The United Fruit Co. has inaugurated a free medical radio service from its hospitals in the various countries of Central America, and from its passenger steamships to all ships at sea. This service is available without charge so far as the United Fruit Co., and subsidiary companies are concerned to ships

of all nationalities through the following radio stations operated by the United Fruit Co., or the Tropical Radio Telegraph Co. :—

<i>Radio Stations</i>	<i>Call Letters</i>
New Orleans, Louisiana	WNU
Burrwood, Louisiana	WBW
Fort Morgan, Alabama	WIO
Swan Island, Caribbean Sea	US.
Tela, Honduras	UC.
Puerto Castilla, Honduras	UA.
Tegucigalpa, Honduras (open November, 1922) ..	UG.
Port Limon, Costa Rica	UX.
Almirante, Panama	UB.
Santa Marta, Columbia	UJ

Radiograms should be signed by the Captain of the ship and should state briefly but clearly the symptoms of the person afflicted. Such radiograms should be addressed "Unifruitco" (name of place) and may be sent to any of the United Fruit Co.'s hospitals listed below :—

- Santa Marta, Columbia.
- Port Limon, Costa Rica.
- Almirante, Panama.
- Tela, Honduras.
- Puerto Castilla, Honduras.
- Puerto Barrios, Guatemala.

DIRECTION FINDING

- (A) **Résumé of Progress and Practice**
- (B) **Regulations and Procedure Relating to
Direction Finding of the Countries
of the World**

MODERN PROGRESS IN RADIO DIRECTION FINDING

By R. L. SMITH-ROSE, M.Sc., D.I.C., A.R.C.S., A.M.I.E.E.

INTRODUCTORY.

ALL modern systems of radio direction finding owe their successful development on a practical scale to the thermionic vacuum tube; since without the use of the amplifying properties of this device, the range of reception of closed circuit coil receivers is very limited. This is probably the sole reason that the early work of Hertz, Fessenden, Pickard, and Round in demonstrating the directive properties of the single closed loop receiver was followed by no immediate application. Although it was actually devised from a different stand-point, the Bellini-Tosi system is in effect identical with a large closed loop, utilising an instrument to produce a secondary field with similar directive properties to those of the original incoming waves. Chiefly on account of its larger dimensions and consequent greater power of absorbing energy from an electromagnetic wave, its range of reception was reasonable, and it had thus attained to commercial proportions prior to 1914.

THE THREE "ZERO" SYSTEMS OF DIRECTIVE-RECEPTION.

The Bellini-Tosi System. (Fixed Aerials).

This system will be dealt with first, because for the reason just given, it was the first to attain practical proportions although it was actually second in order of invention. This system utilises two large loops, fixed with their planes vertical and perpendicular to each other. The E.M.F's. induced in these loops, varying in magnitude according to the angle between the plane of each loop and the direction of the magnetic field of the incoming wave, cause currents in two small coils fixed together at right angles; the circuit formed by each loop and its corresponding coil may be tuned, by condensers, or left untuned. The currents flowing in these two coils produce a resultant magnetic field within them, which has a direction relative to the coils exactly corresponding to the direction of the magnetic field of the wave relative to the loops. The absolute direction of this secondary field, and hence of the incoming waves, may then be determined by a small rotating search coil which will give zero signal intensity in the telephones of the receiver to which it is connected when the plane of the coil coincides with the direction of the secondary magnetic field.

As an alternative to the setting of the coil to the zero signal position, it may be quickly swung between two points to give equality of signal strength. In this case the true direction or bearing is midway between the two points so found. In practice this latter mode of operation is almost universally employed, since the zero may be somewhat ill-defined or may extend over several degrees, due to various disturbing effects and weak signals respectively. With the introduction of the triode amplifier, the range of reception of this system was greatly increased, but only in comparatively minor points was the arrangement altered. The modern instruments are provided with a far greater wavelength range than formerly and the circuit arrangement has been somewhat simplified to give easier operation and freedom from certain instrumental errors. On these general lines, types of this system have been fully developed by the Marconi Company for use on land, on board ship, and for experimental purposes, on aircraft. By utilising the "open aerial" receptive properties of the loops employed, in addition to their directive properties, this system now enables not only the plane of reception, but the actual sense of the incoming waves, to be determined.

The Single Frame System.

With the gradual development of triode amplifiers it was found that quite reasonable reception ranges could be obtained with the original type of vertical closed loop, tuned to resonance with a suitable condenser. Such a loop if easily rotatable about a vertical axis can be used as a direction finder

by simply placing it in the position of zero signal reception when its plane will be perpendicular to the direction of the incoming waves. By the use of several turns of wire in place of the single-turn loops previously employed, practically the same energy reception could be obtained with loops of much smaller area. On these lines a direction finder was developed employing a single-frame coil of size as small as 2 or 3 feet square.

Although some work on this type of instrument has been carried out in this country its development has been chiefly confined to France and America. More especially in the latter country it has been made the subject of concentrated research, and a very successful type has been produced for use both on land and on board ship. The instrument is operated upon a minimum or zero of signal strength, and in the taking of bearings the whole coil is usually swung through the minimum in precisely the same way as the search coil of the former instrument is used. In the use of a radio direction finder on board ship, the readings of the instrument are necessarily dependent upon the direction of the head of the ship, and suitable adjustment must be made for the latter, obtained from the ship's compass. A convenient modification of the single coil in this case is to mount it immediately over the binnacle and arrange its pointer to move over the compass card, from which true radio bearings may then be read. By arranging suitable connections on this set also, the sense of the bearing can be indicated in addition to its plane direction.

The Robinson Crossed-Coil System.

In attempting to take a radio bearing in the presence of large external noise, the two previous systems become very difficult to operate accurately on account of the obscuring of the minimum by the interference. The remedy which is adopted in such cases is to swing the coil or loop through a comparatively large angle to obtain a distinctly audible signal under the prevailing conditions. In the Robinson system, however, an accurate observation of bearing may be made on an audible signal without the necessity of swinging the moving system. The usual type of this instrument employs two frame coils fixed together at right angles and rotating about their common vertical axis. The two coils are connected in series through a reversing switch to a variable condenser to tune the coil system to the incoming waves. According to the position of the switch the E.M.F. in one of the coils is either added to or subtracted from that in the other coil, so that in general a change of signal strength in the telephones results from the operation of the switch. When, however, the coil system is so set that the plane of one of the coils is perpendicular to the direction of the incoming waves, there will be no such change in signal intensity. A slight rotation of the coils in either direction will disturb this balance, and the direction of the incoming waves can thus be determined. The possible 90° ambiguity which might otherwise occur is eliminated by making one of the coils of much greater area-turns than the other, a factor which also increases the sensitivity of the instrument.

Consideration of the theory of this arrangement shows that the two coils perpendicular to each other are equivalent to a single coil of calculable dimensions and set at an angle intermediate between them. The operation of the reversing switch is equivalent in effect to the sudden rotation of this resultant coil through the minimum position of one of the component coils. The angle of swing is determined by the ratio of the area-turns of the component coils and so is fixed for any one instrument. In typical instruments of this type this angle is equal to 20° or 30° for good sensitivity. It is thus evident that this system is in effect equivalent to a single frame coil, which in the presence of considerable interference is swung through the minimum over 20° or 30° for the comparison of equality of signal strength.

THE ERRORS OF DIRECTIVE RECEPTION.

The preceding section is briefly descriptive of the three principal systems of directional radio reception, which crystallised from the large amount of

research carried out up till about 1918. Since that date the work on this subject has been almost confined to the gaining of practical experience in its application to navigation and other problems, and the increase of scope, accuracy and ease of operation of the instruments. Above all things a knowledge of the limits of accuracy of the systems under all conditions is necessary, and it is now proposed to treat this subject under the headings of (a) Instrumental errors, (b) Errors due to local surroundings, (c) Variable errors. It is to be remarked that since each of the systems employed depends upon the setting of part or all of the moving system in a position of zero signal strength, it is to be expected that errors (b) and (c) will affect each system to the same extent, other things being equal. This theoretical deduction has recently been verified experimentally by the author in an investigation, an account of which is shortly to be published.

(a) *Instrumental Errors.*

One of the largest instrumental errors to which the earlier types of apparatus were subject was due to mutual interference, inductive or capacitative, between the fixed and moving portions of the apparatus. The errors due to this cause usually increased with decrease of the wavelength used and varied with the direction of the incoming waves, while the use of multi-valve amplifiers to give increased receptive range certainly augmented the possibility and magnitude of these errors. The bad reputation which was earned for direction finding on continuous waves has been found to be almost entirely due to the errors introduced by inductive interference between the local oscillator employed and the moving system. All these errors can be avoided by judicious arrangement of the apparatus and particularly by adopting efficient methods of screening the various components employed. Electro-magnetic screening enters very largely into a successful direction finding installation as well as in other radio work, and it has recently been made the subject of much experimental research. The enormous sensitivity of modern apparatus requires very much more stringent precautions than were necessary formerly, and the mere use of a so-called Faraday cage is no longer sufficient. An efficient screen or shield to any piece of apparatus for ordinary purposes consists of a complete conductively closed metallic envelope, preferably of sheet iron and of a suitable thickness for the frequency employed. All apertures and movable portions of the envelope necessary for the adjustment of the apparatus within, should be reduced to the minimum.

Another common error in all direction finding instruments is that known as "antenna" effect. This arises from the tendency of the vertical loop or frame to behave as an ordinary open antenna in addition to its directive properties, and combined with the difference in capacity to earth of the grid and filament respectively of the first triode to which the movable coil system is connected, directly or otherwise. The most complete method of eliminating this error is to employ a small variable or "compensating" condenser, connected between the grid and earth, and adjusting it until the total capacity is exactly equal to that from filament to earth. This adjustment is carried out while the bearing is being obtained, and exact compensation is easily detected by the greatly increased sharpness of the zero signal which results. Unfortunately, this adjustment requires to be renewed for at least each change in wavelength, and hence somewhat retards the observation of bearings when searching over a range of wavelengths. An alternative method of nearly eliminating the error of "antenna" effect without the disadvantage just mentioned, is the placing of an earthed "capacity" plate either at a suitable point in the apparatus or else symmetrically over the top horizontal side of the receiving loops. A third method of overcoming the difficulty and also of avoiding any error due to the direct reception of signals on the connecting leads of the apparatus is to enclose the whole of the receiving apparatus, except the loops, inside an efficient metallic screen connected to earth. This latter arrangement has advantage in also screening the operator, who may otherwise contribute not a little to the antenna effect.

With the elimination of the two errors above described most of the difficulties experienced in the early days of direction finding due to a slight mistuning of the coil system have disappeared, although naturally to obtain the best conditions, all the tuned circuits involved are tuned as accurately as possible. In the Bellini-Tosi system exact identity of the electrical constants of the aerial circuits is required, and for ease of operation it is usual in practice nowadays to employ untuned aerials and obtain the necessary selectivity at other points in the circuit.

Other instrumental errors such as those due to the scale and the effect of the coil-shape are more a matter of design and accurate construction. On the whole it may be said that using precautions which are evident in the light of modern knowledge, the instrumental errors of the direction finding systems may be reduced to a quantity which is negligible compared with other errors which are at present beyond control.

(b) Errors due to local surroundings.

Much quantitative knowledge has been obtained during the last two or three years upon the effect of various surrounding objects on a radio direction finder. This knowledge is undoubtedly invaluable to those having the responsibility of erecting such installations on land and in some cases on board ship. To give even a summary of this data is beyond the scope of the present article, but a brief review may be given of the effects observed. In the majority, if not in all, instances, the effect on the direction finder is a secondary one due to the distortion of the field of the arriving waves by the currents set up in the disturbing objects.

Masses of metal-work commence to have a serious effect upon the readings of a direction finder when their dimensions become comparable with the coils of the latter concerned. With increasing size of the metal-work, the errors in reading become greater and the strength of the signals received is appreciably reduced. A somewhat rough rule which is, however, a useful guide in selecting sites, is that a metallic mass will not produce any serious effect on a direction finder if it is placed at a greater distance than its largest linear dimensions. In some of the author's experiments, errors ranging up to nearly 30° were produced by a small frame coil used in the neighbourhood of a large iron shed. An instance in which these errors due to metal-work are not easily avoided is that of working on board ship. In this case the hull and distributed metal-work produce an error of a quadrantal nature which may have a maximum value ranging from 10° to 30° . Fortunately, this error is independent of wavelength and by adopting reasonable precautions may be kept constant, so that a calibration curve may be made for the direction finder after its installation. By analogy with that of a ship it will be appreciated that any metal-work underground may produce serious errors at a land installation.

Tuned aerials, long stretches of overhead wires and trees may each be responsible for errors on a direction finder within several hundred feet, so that a comparatively clear site on land is essential for successful working. Sudden changes in the conductivity of the ground, such as in passing from sea to land, also produce errors in the observed directions of waves, which are however only appreciable on wavelengths below 2,000 metres.

(c) Variable errors.

If, at any installation, the errors mentioned in the two previous sections cannot be entirely eliminated they can usually be rendered fairly permanent in their effects and hence a previous calibration may be used to correct all bearings observed. There is now to be mentioned another class of error, which is extremely variable both from day to day and especially during the night. The existence of this class of error is only appreciated by taking repeated observations upon stations the true direction of which is known. The variations then experienced are so erratic in their nature that no definite law concerning them has yet been formulated and no method of eliminating them or compensating for them has yet been devised.

Considering the frequency with which this class of error is met with on any system of direction finding, the quantity of data which has been made public is comparatively small. Observations on a large scale are now in progress in several parts of the world, and the author has been largely concerned with the work in this country, being carried out under the auspices of the Radio Research Board.

Day Variations.

Definite variations in observed bearings take place in daylight, which cannot be ascribed to instrumental or observational errors. In some cases these may be due to changes in the conductivity of the ground, due to moisture, giving a variation in the error mentioned in the last paragraph of (b) above. On other occasions, however, variations from day to day take place under identical weather conditions. The magnitude of these variations is not usually large in daylight, the greatest difference from the mean amounting to about three or four degrees.

Night Variations.

When night conditions prevail over the portion of the earth between a transmitter and receiver, the variations assume a magnitude and frequency which make any radio bearings very unreliable. The general nature of night variations is very complex and their magnitude ranges from 10° to at least 60° . In some cases a practically steady deviation takes place for a considerable time; on other occasions observed bearings alter at the rate of several degrees per minute. The variations appear to depend upon a large variety of conditions from the transmitter to the receiver and from the surface of the earth up to the top of the atmosphere. Apparent laws have been made upon a few scattered readings only to be disproved by further continued observation. Variations observed at one portion of the earth appear to be quite different from those at another place at the same time and under exactly similar conditions. Observations made simultaneously at the same place on different transmitting stations frequently give errors which totally disagree among themselves.

The salient point which has arisen out of the work already carried out is that radio direction finding over any appreciable distance at night is very unreliable for navigation or other purposes. There is at present no certain means of determining whether any observed bearing is correct or otherwise at the time of recording. Much discussion of a theoretical nature has taken place on this subject, but even accepting the assumptions upon which this is based, no theory yet explains all the variations which have been observed. Many attempts have been made to avoid or eliminate these errors but so far without success. The wisest course to adopt in these circumstances seems undoubtedly to be to reserve opinions until sufficient accurate quantitative data, embracing as far as possible all conditions, is available for the testing and checking of the theories. Whatever may be the outcome of this and its effect on the present practice of radio direction finding, it will also undoubtedly add very materially to the knowledge of the more general problem of the transmission of electro-magnetic waves over the earth's surface, and so will benefit the theory and practice of radio communication in general.

DIRECTIONAL TRANSMISSION.

(i) *Closed Loop Radiators.*

The general law of radiation, viz., that a good absorber of electromagnetic waves is also a good radiator, holds equally for radio frequencies as for those of heat and light radiation. It will, therefore, be understood that a closed frame coil supplied with the necessary electrical power will radiate waves having similar distribution to the receptive properties of the coil. If the plane of the coil is vertical the radiation in different directions in a horizontal plane passes through a sharp zero in the direction of its axis. Hence, if the coil radiator is arranged to rotate about a vertical axis, the signal received at a distant station will pass through a sharp minimum, as the plane of the coil

passes through the position of perpendicularity to the line joining the two stations. If the transmitting station be arranged to send out a code signal when the coil is in some definite geographical direction, an observer at any receiving station can obtain the direction of the incoming signals by a simple time observation. This system possesses the advantage that any receiving station using any kind of antenna may obtain bearings by means of a stop watch, while the disadvantages for navigation purposes are that the observations are limited to those on the special directive transmitting stations, which latter also must be maintained in continuous operation, a somewhat bad feature from the point of view of interference. One modification of the simple rotating loop which has been in operation, is a series of large fixed loops spaced about a common axis, with a rotating switch interchanging the connections of each loop in turn. Other modifications that also have been used in at least the experimental stage are inversions of the Bellini-Tosi and Robinson systems respectively.

On the whole it cannot be said that these methods have led to great success so far for practical direction finding. The radiated energy from closed loops is comparatively small for any appreciable distance, and is necessarily limited by the power that can be fed to the loop. From the point of view of accuracy, also, it is doubtful if there is anything to gain over the directive receiver. The instrumental errors are practically entirely transferred to the transmitter, while any deviations suffered by the waves *en route* will also exist to the same extent.

While not denying the possibility, sufficient evidence is not yet available to state whether the abnormally large variations in bearings will still be present when using directive transmission.

(ii). *Rod Oscillators with reflectors.*

In the early days of radiotelegraphy, attempts were made to use reflectors to concentrate the radiated waves in the required direction, from the view of economy rather than for any direction-finding applications. On account of the increased wavelengths employed to obtain the necessary power, the corresponding size of such mirrors became impracticable. That most useful device in modern radio, the triode vacuum tube, has, however, provided a means of generating short wavelengths of 20 metres or less in quite appreciable powers. Demonstrations of remarkable experiments in this direction by Marconi and Franklin have been recently given in both this country and America. Using a simple Hertzian rod oscillator coupled to a small triode generator, waves of as short as 1 or 2 metres are produced, and these are easily concentrated into a parallel beam by means of a parabolic reflector. The fundamental properties of electromagnetic waves are easily demonstrated in experiments which are very reminiscent of the classical researches of Hertz.

In the practical use of these waves, it will be evident that no receiver which is not within the limits of the beam will give any response. This provides in effect partial secrecy to any communication carried out in this manner; and although atmospheric absorption becomes very large at these short wavelengths, successful telephone transmission has been carried out over distances exceeding 60 miles using reflectors at each end. For directive purposes an oscillator is set up with its parabolic reflector and arranged to rotate about a vertical axis. A radio beam is thus sent out, which sweeps over the 360° in a horizontal plane, in exactly the same way as the visible beam from a lighthouse rotates. Using a rod receiver and suitable detecting apparatus, the flashing of the beam past any distant object, *e.g.*, a ship, may be detected. It is then an easy matter for code signals to be sent out from the transmitter which indicate at every few degrees the precise direction of the beam. Experiments on these lines have already been carried out using a 4-metre wave and a revolving reflector. With a single valve receiver on board a ship, a working range of seven nautical miles was obtained, bearings being determined to within 3° .

LAWS, REGULATIONS AND PROCEDURE RELATING TO DIRECTION FINDING

Note.—Special regulations affecting aircraft for direction and position finding, in addition to those printed below, are contained in the Aviation Section.

THE following is an extract of the Laws, Regulations and Procedure adopted by the various countries of the world and obtained in some instances from publications issued by them.

Wireless direction-finding stations (W/T D.F.) are either existing wireless telegraph stations or stations especially constructed for the purpose on shore, which are equipped with apparatus enabling them to ascertain the direction from which wireless signals transmitted by other stations emanate, and particularly from ships at sea.

The procedure to be generally adopted varies to some extent with different stations, both regarding the wavelength to be used and the general procedure for requesting and acknowledging bearings. In general, a ship requiring its position calls up a direction-finding station or stations either singly, or as is often the case when one station controls one or more others, collectively, requesting, in the proper procedure laid down, its position. The station or stations called again in proper procedure, reply with the true bearing of the ship from that station. The accuracy of these bearings so obtained depends largely on certain conditions which are outlined below, but generally speaking, they can be considered accurate to within two degrees.

Administrations of the various countries controlling such direction-finding stations accept no responsibility for the consequences of any bearing being inaccurate, but where three direction-finding stations can be employed suitably situated to give intersecting bearings, almost complete reliance can be placed on the results so obtained, provided that the triangle of error ("cooked hat") formed by the intersection of bearings is small.

To obtain the greatest possible degree of accuracy, it is important that the ship station should use low power to transmit. Signals should be fairly strong and clear, and the signal strength be kept steady with strict attention to spacing. Any instructions for procedure given by the countries in which direction-finding stations are situated should be strictly adhered to.

In direction finding there is always a possible error of 180° . Darkness, fog, stormy weather and coast line errors have also to be taken into account. Nothing should be left to chance when obtaining bearings; every possible precaution should be taken to ensure their accuracy.

It is expected that before long an international agreement will standardise the procedure to be adopted for the requesting and giving of bearings and the wavelengths to be used for such communications. Meanwhile, each country has rules and regulations governing the use of its own direction-finding stations.

There are three systems of direction finding at present operating, viz. :—

- (a) Where each direction finding station is fitted with transmitting and receiving apparatus and works independently.
- (b) Where several direction finding stations (usually situated near a harbour entrance or difficult passage) are linked together by special telegraph cables and are all controlled by one telegraph station, which alone is fitted with transmitting apparatus. Controlling stations in such cases are usually not direction finding stations at all, but the ordinary coast stations.
- (c) Where a ship requires a single bearing only. In this case the vessel calls the wireless stations nearest to the direction finding station, which calculates the bearing, and it is then transmitted by the wireless station.

A large number of ships are now fitted with direction finding apparatus and can obtain their own position by operating on one or more fixed position transmitting stations. In such cases the ship is, of course, independent of

shore direction finding stations and can obtain its position at more or less any point of the globe.

Direction finding is also being considerably developed in regard to aviation particularly with the cross-channel airways. It has, on several occasions, in adverse weather conditions, been exceedingly useful and is getting to be more and more to be relied upon. With aircraft direction finding is usually carried out by means of radiotelephony. The position can normally be given within two minutes. In the case of both ship and air vessels, direction finding should be practised in clear weather, in order that proficiency and reliability may be obtained.

FIXING POSITION BY WIRELESS DIRECTIONAL BEARINGS.

(N.B.—The W/T stations referred to in this article are fictional.)

I.—GENERAL.

Fixing position by directional wireless is very similar to fixing by cross bearings from visible objects, the principal difference being that, when using a chart on Mercator's Projection, true bearings have to be changed into mercatorial bearings, the wireless stations being generally at very much greater distances than the objects used in an ordinary cross bearing fix.

Although fixing position by wireless directional bearings is dependent for its accuracy upon the degree of precision with which it is at present possible to determine the direction of wireless waves, subsequent confirmation of the course and distance made good, by the receipt of additional bearings, would afford confidence to those responsible in the vessel as the land is approached under weather conditions that preclude the employment of other methods.

At the present time, from shore stations with practised operators and instruments in good adjustment, the average error in direction should not exceed 2° for day working, but it is to be noted that errors at night may be larger, although sufficient data on this point is not at present available.

III.—CONVERGENCY.

Meridians on the earth's surface not being parallel but converging towards the poles, it follows that a great circle will intersect meridians as it crosses them at a varying angle. The difference in the angles formed by the intersection of a great circle with two meridians (*i.e.*, convergency) depends on the angle the great circle makes with the meridian, its middle latitude between the meridians, and the difference of longitude between the meridians.

This difference is known as the convergency, and can be approximately calculated from the formula:—

Convergency in mins. = diff. long. in minutes $\times \sin$ mid. lat.

Convergency may be readily found from the Convergency Scales (Fig. 1) or it may be found by traverse table entering the D. long. as distance and mid lat. as course; the resulting departure being the convergency in minutes

IV.—TRUE AND MERCATORIAL BEARINGS.

Meridians on a Mercator's chart being represented by parallel lines, it follows that the *true bearing* of the ship from the station, or *vice versa*, cannot be represented by a straight line joining the two positions, the straight line joining them being the *mean mercatorial bearing*, which differs from the true bearing by $\pm \frac{1}{2}$ the convergency. As it is this mean mercatorial bearing which we

Scales for obtaining the Convergency for 10' Diff. Longitude in different Latitudes

Example:— Mid Lat. 50°30', diff. long. 282; To find the Convergency.
Under 50°30' on Mid. Lat. scale read 7.7 on scale of Convergency
which multiplied by 28.2 gives 217" the Convergency

Fig. 1.

II.—TRACK OF WIRELESS WAVE.

The track of a wireless wave being a great circle is represented on a chart on Mercator's Projection by a flat curve, concave towards the equator; this flat curve is most curved when it runs in an east and west direction, and flattens out as the bearing changes towards north and south. When exactly north and south it is quite flat and is then a straight line, the meridian. The true bearing of a ship from a W/T station, or *vice versa*, is the angle contained by the great circle passing through either position and its respective meridian.

require, all that is necessary when the true bearing is obtained from a W/T station is to add to or subtract from it $\frac{1}{2}$ the convergency and lay off this bearing from the station.

V.—SIGN OF THE $\frac{1}{2}$ CONVERGENCY.

Provided the bearings are always measured in degrees North 000° to 359° (clockwise) the sign of this $\frac{1}{2}$ convergency can be simply determined as follows:—

N. lat. .. $\frac{1}{2}$ convergency is + to the bearing given by the W/T station when ship is E. of station.

N. lat. ... $\frac{1}{2}$ convergency is — to the bearing given by the W/T station when ship is W. of station.

S. lat. ... The opposite.

When the W/T station and the ship are on opposite sides of the equator, the factor $\sin \text{mid. lat.}$ is necessarily very small and the convergency is then negligible. All great circles in the neighbourhood of the equator appear on the chart as straight lines, and the convergency correction as described above is immaterial and unnecessary.

VI.—EXAMPLE.

A ship is by D.R. in lat. $48^{\circ} 45' \text{ N.}$, long. $25^{\circ} 30' \text{ W.}$, and obtains wireless bearing from Sea View $244\frac{1}{2}^{\circ}$ and from Ushant $277\frac{1}{2}^{\circ}$. What is her position?

Sea View Lat. $55^{\circ} 22' \text{ N.}$ Long. $7^{\circ} 19\frac{1}{2}' \text{ W.}$
D. R. „ $48^{\circ} 45' \text{ N.}$ „ $25^{\circ} 30' \text{ W.}$

Mid. lat. $52^{\circ} 03' \text{ N.}$ Diff. long. $1090.5'$
Convergency = $1090.5' \times \sin 52^{\circ} = 859'$
or $\frac{1}{2}$ convergency = $7^{\circ} 09'$

The true bearing signalled by Sea View was $244\frac{1}{2}^{\circ}$, as ship is west of the station (North lat. see paragraph V.), the $\frac{1}{2}$ convergency will be “minus” to the true bearing signalled.

Lat. $48^{\circ} 27\frac{1}{2}' \text{ N.}$, long. $25^{\circ} 05' \text{ W.}$, which is the ship's position.

Note.—In plotting the positions the largest scale chart available that embraces the area should be used. A station pointer will be found convenient for laying off the bearings where the distances are great.

The chartlet (Fig. 2), drawn on the Mercator's Projection shows the above positions and the error involved by laying off the true bearings as signalled from Sea View W/T and Ushant W/T.

The solid lines are the great circles passing through Sea View and ship's position and Ushant and ship's position.

The pecked lines are the true bearings laid off as signalled, their intersection (B) being in lat. $50^{\circ} 14' \text{ N.}$, long. $25^{\circ} 46' \text{ W.}$, or approximately $110'$ from the correct position.

The dotted lines are the mean mercatorial bearings laid off from Sea View and Ushant and their intersection (C) gives the ship's position very nearly, i.e., lat. $48^{\circ} 27\frac{1}{2}' \text{ N.}$, long. $25^{\circ} 05' \text{ W.}$

Position A is the ship's D.R. position, lat. $48^{\circ} 45' \text{ N.}$, long. $25^{\circ} 30' \text{ W.}$, which was used for calculating the $\frac{1}{2}$ convergency.

Note.—As the true position of the ship should

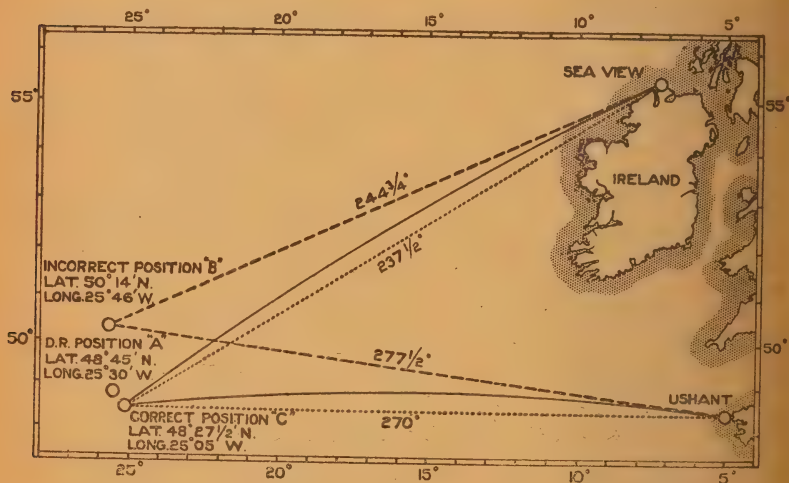

Fig. 2.

Therefore the mercatorial bearing will be $237\frac{1}{2}^{\circ}$ nearly.

Similarly with Ushant.

Lat. D. R. $48^{\circ} 45' \text{ N.}$ Long. $25^{\circ} 30' \text{ W.}$
„ Ushant $48^{\circ} 26\frac{1}{2}' \text{ N.}$ „ $5^{\circ} 05\frac{1}{2}' \text{ W.}$

Mid. lat. $48^{\circ} 36' \text{ N.}$ Diff. long. $1224.5'$
Convergency $1224.5' \times \sin 48^{\circ} 36' = 919'$
or $\frac{1}{2}$ convergency = $7^{\circ} 40'$

The true bearing signalled by Ushant was $277\frac{1}{2}^{\circ}$, as ship is west of the station (North lat. see paragraph V.), the $\frac{1}{2}$ convergency will be “minus” to the true bearing signalled. Therefore the mercatorial bearing will be 270° nearly.

Laying off $237\frac{1}{2}^{\circ}$ and 270° on the chart from Sea View and Ushant respectively the intersection will be in:

have been used to obtain the $\frac{1}{2}$ convergency the quantity found is not correct, but it could be recalculated using lat. and long. (c) and a more correct value found. This, however, is only necessary if the error in the ship's assumed position is very great.

VII.—ACCURACY OF THIS METHOD OF PLOTTING.

Although this method is not rigidly accurate, it can be used for all practical purposes up to 1,000 miles range, and a very close approximation found to the position lines upon which the ship is at the moment the stations receive her signals.

VIII.—USE OF W/T BEARINGS WITH OBSERVATIONS OF HEAVENLY BODIES.

It follows that W/T bearings may be used in conjunction with position lines obtained from

observations of heavenly bodies, the position lines from the latter being laid off as straight lines (although in this case also they are not strictly so), due consideration being given to the possible error of the W/T bearings. Moreover, W/T bearings can be made use of at short distances as "position lines," in a similar manner to the so-called "Summer line" when approaching port, making the land, avoiding dangers, etc.

CANADA

Direction finding wireless stations are maintained by the Dominion at St. John, N.B., Chebucto Head, N.S., Canso, N.S., and Cape Race, Newfoundland. These are of the Bellini-Tosi type, stationary aerial. All bearings are given on the 800 metre wave. For the present no charge is made for bearings supplied.

1. A ship wishing to obtain her bearings should call the D.F. station required on 800 metres and transmit the signal QTE? using commercial procedure as follows:—

EXAMPLE:

Ship (call sign CHR) calls up station required (call sign VAV):—

— • • • — VAV VAV VAV — • • • CHR
CHR CHR QTE? — • • • —

The D.F. station on acknowledgment the receipt of the signal QTE? will say whether it is ready to take the bearing at once, or whether the ship is required to wait.

If the D.F. station is ready to take the bearing, it will make:—

CHR R QTE VAV — • • •

2. On receiving this acknowledgment of the signal QTE? and the signal — • • • (go) the ship will make: — • • • — etc. (— • • • — repeated 30 times) — • • • — CHR.

3. If the D.F. station is not satisfied with the bearing it will make — • • • — to the ship, which will repeat — • • • — 20 times (as above); otherwise the D.F. station does not answer until the bearing has been worked out, when the station will immediately call the ship and transmit the TRUE bearing of the ship from the station in degrees from 000° to 359°, in Government message form, all angles being measured clockwise from true North (000°).

4. Should a ship be within range of and wish to obtain her bearings from more than one D.F. station, she should, if possible, call up the individual stations required, and carry out the above procedure simultaneously with all stations in order to avoid undue interference.

5. Well tuned, clear signals, of medium or fair strength are essential for accurate direction finding. The D.F. station will, if necessary, direct the ship to increase or decrease power so that signals are not stronger than desirable. Care must be taken to keep the note and strength of signals steady, and pay proper attention to spacing. The sharper the tuning, the more accurate will be the bearing; therefore, coupling should be as loose as possible, consistent with the required strength of signals.

6. It must be understood that D.F. station bearings are susceptible to errors at night, and also when the bearing lies roughly along the coast line.

Under normal conditions errors are not likely to exceed 2°.

If conditions are such that the error may exceed 1°, then the bearing will be given as approximate, this being denoted by the suffix

IX.—CONVERSE METHOD.

When ships are fitted with apparatus by which they record the wireless bearings of shore stations whose positions are known, the same procedure for laying off bearings from the shore stations can be adopted; but it is to be remembered that in applying the $\frac{1}{2}$ convergence to these bearings it must be applied to the converse way, in both hemispheres, to that laid down in paragraph V.

"app" to the bearing, e.g., "App 148 degrees." The error in these approximate bearings is not likely to exceed 4°, and will generally not exceed 2½°.

Ships should note that a D.F. station cannot distinguish between the bearing of the ship and its reciprocal, unless the reciprocal bears inland. In the case of doubt, the station will give the ship the two possible angles from true North the decision being left to the ship as to which is her correct bearing. When two angles are given they will not necessarily differ by the theoretical 180°, since there may be deviation corrections applied by the D.F. station, which vary slightly at opposite points of the compass.

7. With a view to checking up the work of D.F. stations, a record of the actual position of a ship at the time a bearing has been obtained will be of the greatest assistance to the department, and if the circumstances are such that the ship's officers can determine fairly accurately by back reckoning or otherwise, such position a brief report should be forwarded to the Canadian Government Wireless Inspector at the nearest Canadian port at the first opportunity, containing:—

- (a) Name of ship.
- (b) Name of D.F. station.
- (c) Date and G.M.T. at which bearing was given.
- (d) Bearing given by D.F. station.
- (e) Estimated position or bearing of ship at above time and date by methods other than D.F. bearings.
- (f) The probable degree of accuracy of the above-mentioned estimated bearing or position.
- (g) Weather conditions at above time.
- (h) Remarks, if any.
- (i) Signature of Master or responsible Navigating Officer.

Forms for this purpose may be obtained upon request from the:—

Deputy Minister, Department of the Naval Service, Ottawa, or from the Government Wireless Inspectors at:—

H.M.C. Dockyard, Halifax.
Old Custom House, 1, Common Street Montreal (during summer).
Old Post Office Building, St. John, N.B. (during winter).

8. The operator must not ask for a bearing except when instructed to do so by the master of the vessel.

9. No charge will be made by the Canadian Government for the above service until further notice.

FRANCE AND ALGERIA

Acts and decrees affecting direction finding are to be found under France and Algeria in the Laws and Regulations Section.

A.—Low Power W/T D.F. STATIONS.

1. French low power W/T D.F. stations keep watch on a wavelength of 600 metres (damped), which must be used for calling by ships desirous of obtaining their bearings.

The D.F. station called replies on the same wave.

The bearing wave (*i.e.*, the wave on which the ship transmits the signal permitting the station to make the observation for the bearing) is either 800 metres or 450 metres, at the option of the ship. The wavelength of 600 metres can be used by ships which cannot transmit either on 450 or 800 metres.

The result of the observation is transmitted by the D.F. station on the same wavelength. Toulon and Casablanca, however, always transmit the result on 800 metres, whatever the bearing wave may be.

2. The abbreviations used are:

QTE?—What is my true bearing relatively to you (or to)?

QTE—Your true bearing relatively to me (or to) is

The bearings are indicated by a number consisting of three figures. They are reckoned from 000 to 359 clockwise, thus: North=000°; West=270°.

3. A ship desires to obtain bearings from a single station or simultaneously from several stations.

The procedure to be observed is as follows:

(a) The ship calls the station (or stations) on the 600 metres wave, and transmits the signal "QTE?" followed by the call signals of all the stations from which he requires observations, and a number indicating the wavelength to be used. She then listens on 600 metres.

(b) The D.F. stations called prepare to take the bearings, and, when ready, reply in the alphabetical order of their call signals, directing the ship by the signal K to commence transmission; this signal is followed by a figure giving the intensity of the signal (scale=1 to 9) to be made by the ship.

(c) On receiving the signal K the ship adjusts her transmitting gear accordingly, and sends her own call signal for 50 seconds. She then listens on the same wave.

(d) The stations, replying in the alphabetical order of their call signals, give the results of their observations by the signal QTE followed by a group of three figures indicating the bearing; or may, if necessary, ask the ship to repeat the preceding message.

EXAMPLE.

A ship ABC requires bearings from the D.F. stations Brest—Moulin du Seigneur (FEI) and Ouessant—Pen-ar-Roch (FEO), on a wavelength of 450 metres.

The various operations are effected in the following order:

(a) ABC calls on 600 metres the two stations:

VE FEI FEI FEO FEO V ABC QTE?

FEI FEO 450 AR.

ABC having transmitted this signal listens on 600 metres.

(b) FEI replies on 600 metres:

VE ABC V FEI 450 K 6

FEO replies on 600 metres:

VE ABC V FEO 450 K 7

(c) FEI and FEO adjust their receiving apparatus to 450 metres.

ABC also adjusts her receiving apparatus to 450 metres, and signals:

VE FEI FEO V ABC ABC ABC.....(for 50 seconds) AR

ABC then listens on 450 metres.

(d) Both shore stations having made the necessary observations, find that at 1545 G.M.T. (civil):

FEI 330° FEO 070°

FEI thereupon signals on 450 metres:

VE ABC V FEI 1 BT 1545 QTE 330 AR

FEI

ABC acknowledges receipt by making:

VE FEI V ABC R II VA

FEO then signals on 450 metres:

VE ABC V FEO 3 BT 1545 QTE 070

AR FEO

ABC acknowledges receipt by making:

VE FEO V ABC R II VA

All stations concerned after repeating VA resume their normal service.

NOTE.—(1) The figure 1 and 3 before the signal BT give the registered number of the bearing on the station register; 1545 refers to the civil mean time of the meridian of Greenwich (the first two figures representing the hours, and the last two the minutes).

(2) If one of the stations (*e.g.*, FEO) desires to repeat the message the bearing not having been made correctly at the first transmission, it makes the signal:

VE ABC V FEO UD

The ships again repeats her call signal for 50 seconds as in (c); the remaining portion of the message is then sent as stated.

B.—HIGH POWER W/T D.F. STATIONS.

The procedure to follow for obtaining bearings is analogous to that indicated for low power stations.

The wavelengths for watchkeeping and for the bearing are the same, *viz.*, 2,100 metres (continuous wave).

If the D.F. station is connected to a W/T station keeping permanent watch on 2,400 metres (C.W.), a ship can ask for the bearing on 2,100 metres (C.W.) by applying to the D.F. station on 2,400 metres (C.W.), (*e.g.*, Trinité W/T D.F. is connected to Brest—Mengan W/T).

In this case the wavelength of 2,400 metres (C.W.) is used for calling only; and the wavelength of 2,100 metres (C.W.) is used for all the signals that follow.

CHARGE.—A charge of six francs is made for each bearing.

CAUTION.—When the bearing between the ship and the D.F. station is parallel, or nearly so, with the general trend of the coast, its accuracy cannot be relied on. The error under such conditions may be as large as 10°. It is necessary, therefore, to warn ships against the use of D.F. bearings, when the angle between the line of bearing and the coast is less than 20°. If, however, circumstances necessitate the acceptance of a bearing under these conditions, the amount of possible error must always be taken into account.

NOTE.—The French Government decline all responsibility so far as the accuracy of the bearings transmitted is concerned.

GERMANY

Radio compass stations belong to the State Marine, but are also available for public use.

For the radio direction finding service there are, on the German coasts, the radio direction finding stations of Borkum F.R.A., Nordholz F.R.A., List F.R.A., Stolpmünde F.R.A., and Warnemünde F.R.A., which are supported by the directional indications of the wireless stations of Borkum F.S., Nordholz F.S., List F.S., Stolpmünde F.S., Warnemünde F.S. and Wilhelmshaven III, Einfahrt F.S. The directional indications are given free of charge. Further installations of this kind will, it is anticipated, be erected at Cuxhaven and Norddeich. The radio directional stations of Stolpmünde F.R.A. and Warnemünde F.R.A., are used for naval service traffic only. Further particulars as to the geographical position, etc., are to be found in the Nomenclature Officielle des stations radio-télégraphiques, etc.

A ship requiring bearings should call Wilhelms-haven Radio Compass Station (KAN) according to International Regulations, on wave of 600 metres. That station makes the necessary arrangements with the radio compass stations, and communicates the position ascertained in latitude and longitude to the vessel concerned.

The signals employed are:

QTE—What is my true wireless bearing?
Your true bearing is degrees.

QTF—What is my ship's position by wireless bearing?

Ship's position is

KAN thereupon signals the ship concerned to wait, and, on another wave, requests the D.F. stations to give the bearings. As soon as the latter are ready, KAN requests the ship to send VVVs. This the ship does for one minute (first of all transposing the transmitter to the 800 metres wave), frequently interspersing the signal with her own call signal.

When Send VVVs is signalled for the first time, and the bearing fails to reach the D.F. station, the latter replies "No bearing." In this case the vessel is ordered to repeat. This signal need not last longer than a minute. After VVVs have been sent, the transmitter should be altered back to 600 metres.

Bearings are reckoned true from the D.F. station concerned. Errors in the individual bearings may amount to 2°. From bad tuning, indifferent transmission and other causes, errors may sometimes be increased. Bearings running nearly in the direction of the coast line are subject to greater variation, as are also those passing alternately over water and land. When intermittent fog occurs, fog banks lying in the line of bearing can occasion divergence, and thereby give rise to corresponding errors in the bearings.

Large ships are recommended generally to use example (a), as in fixing the ship's position on board, any errors in the individual bearings are more easily recognised and can be adjusted.

Example (b) is intended mainly for smaller vessels on which in heavy seas accurate plotting on the chart is attended with difficulty.

As a third case it may happen that a vessel only obtains a single bearing from one D.F. station; in this case she calls up the nearest station (see under example (c)).

For ships which are unable to alter the transmitter to the 800 metres wave, it is possible for bearings to be given on 600 metres. In this case the signal "QSY 600" should be added to the signal "QTE?" or "QTF?" when asking for bearings; for method see under example (d). It should be observed, however, that, judging from experience, the 600 metres wave does not give such good results as the 800 metres.

EXAMPLES.

Wilhelmshaven contro: station call signal—KAN

S.S. "Kleist" call signal—DST

Borkum W/T—KBM

Nordholz W/T—KBN

List W/T—KAL

Borkum W/T D.F.—KBO

Nordholz W/T D.F.—KBQ

List W/T D.F.—KAO

(a) S.S. "Kleist" requires bearings from each of the three D.F. stations (on 800 metres wave).

(1025 Advice from the stations on completion of the bearing.)

NOTE.—Communication between KAN and the D.F. stations is carried on a different wave, so as not to interfere with the messages on 600 metres.

(b) S.S. "Kleist" requires her position by wireless bearing (on 800 metres wave).

The method employed is similar to (a), except that the ship asks for "QTF?" not "QTE?," and obtains her position by latitude and longitude.

(c) The ship (DST) requires only a single bearing from a D.F. station (on 800 metres wave). She calls the W/T station belonging to the W/T D.F. station concerned, with which she exchanges signals. The bearing in this case also is reckoned from the D.F. station

REMARKS.—Should bearings or the ship's position be required through the three D.F. stations on the 600 metres wave according to examples (a) and (b), the procedure should be as above. In these cases the Control stations signals the D.F. stations as follows:—

Bearing B DST λ 600 m.

NOTE.—Mid-European time is used, the hours and minutes being expressed in four figures from 0000 to 2359.

GREAT BRITAIN*

Acts and laws affecting direction finding are to be found under Great Britain in the Laws and Regulations Section.

All D.F. stations keep watch and take bearings on the 450 metres wave; the use of any other wave is strongly to be deprecated. They work as independent stations and can transmit, as well as receive, on 450 metres.

Ships with Marconi apparatus can adjust their transmitting gear very nearly to this wave (using reduced power) by cutting out half the primary transmitting condenser and adjusting the A.T.I. till the earth lamp shows maximum current in the aerial. The primary slider should be "all in."

The actual procedure to be adopted by ships requiring bearings will depend upon what stations are concerned. It should be observed that if the stations to be called do not all keep watch on the same wave, bearings should be asked for separately. If on the other hand the stations to be called all keep watch on the same wave, they should be called up together and the bearings taken in one operation. If, however, two or more stations are linked by special land lines, only one of them should be called up. In such cases, however, the ship must specify in the preliminary signal the D.F. stations which are required to supply bearings.

The following signals are to be used:—

Signal.	Meaning.
QTE ?	"What is my true bearing from you (or from)?"
QTE	"Your true bearing from me (or from) was degrees."

(a) The ship calls the station or stations on the appropriate wave, making "QTE ?" in conjunction, if necessary, with the call signals of the stations from which bearings are required and also (if the call is *not* made on 450 metres) by the figures "450," signifying that the ship will shift to 450 metres for the taking of the bearing. The ship then awaits instructions.

EXAMPLE 1.

A ship whose call is XYZ requires bearings from BXV and BZW.

The ship, having first shifted to 450 metres, calls BXV thus:—

CT BXV BXV de XYZ QTE BXV BZW ?
 She then awaits instructions.

EXAMPLE 2.

The ship (XYZ) requires a bearing from BXK. The ship has to use 600 metres to call GMH. She calls on 600 metres, thus:—

CT GMH GMH de XYZ QTE BXK ? 450.

She then gets ready to shift to 450 metres and awaits instructions.

(b) The station or stations called then make the necessary arrangements and, when ready, answer in alphabetical order of their call signals (if more than one was originally called) and make "K" (go on) preceded by "450" if 450 has been made in the original call.

EXAMPLE 3.

BXV, in Example 1 above, warns BZW by land line and, when both are ready, makes on 450 metres:—

CT XYZ de BXV K.

EXAMPLE 4.

GMH, in Example 2 above, warns BXK by land line and then makes on 600 metres:—

CT XYZ de GMH 450 K.

GMH then shifts to 450 metres so as to be ready to give the result when received by wire from BXK.

(c) On receiving "K," the ship, having shifted transmitting wave to 450 metres (if not already done), then makes her own call signal for 60 seconds and awaits the result.

EXAMPLE 5.

The ship (XYZ) in Example 1 above, makes on 450 metres:—

CT BXV de XYZ XYZ XYZ etc. (for 60 seconds) XYZ.

EXAMPLE 6.

The same as Example 1, reading GMH for BXV.

(d) The station or stations then reply (in alphabetical order if more than one) either asking the ship to repeat (?) or giving the result. The result is given by the signal QTE followed as necessary by the call signal

* At present including Ireland.

and by a group of *three* figures (000 to 359) indicating the true bearing from 000° to 359° of the ship *from* the station. Several bearings can be combined into one message, each bearing immediately following the call signal of the station which took it. The time of handing in is always expressed in Greenwich mean time (civil) for all messages giving bearings to merchant ships.

EXAMPLE 7.

BZW, in Example 1 above, is not satisfied with the bearing and informs BXV. BXV makes on 450 metres:—

CT XYZ de BXV?

The ship at once complies by making on 450 metres:—

CT BXV de XYZ XYZ XYZ, etc. (for 60 seconds) XYZ.

BZW is then satisfied that the bearing is 340° and informs BXV, while BXV finds that its own result is 37°. BXV therefore makes on 450 metres:—

CT XYZ XYZ de BXV 1 9.45 M (time)
=QTE BZW 340 BXV 037 + BXV.

EXAMPLE 8.

BXK, in Example 2, above, gets a satisfactory bearing of 329° and informs GMH. The latter makes on 450 metres:—

CT XYZ XYZ de GMH 2 10.46 S (time)
=QTE BXK 329 + GMH.

EXAMPLE 9.

Had the ship (XYZ) merely asked BVY for a bearing. BVY, finding it to be 246°, would make on 450 metres:—

CT XYZ XYZ de BVY 1 7.6 M (time)
=QTE 246 + BVY.

(e) In order to confirm to the D.F. station that the message has been received correctly, the ship on receiving the result will repeat back the message. The station will then acknowledge or repeat if necessary, and when satisfied that the ship has received the message correctly will make the "end of work" sign. This sign is then repeated by the station or stations concerned. It is important that the "end of work" sign should not be omitted, since it not only indicates that the operation is finished, but it also shows that all concerned are about to resume watch on their normal wave.

The stations are operated by the Royal Navy, but are available for the use of the Mercantile Marine.

A charge of five shillings (5s.) will be made for each bearing asked for and given. Thus, if bearings from two stations or two separate bearings from one station were asked for, the charge would be ten shillings (10s.).

Charges will be collected by the Accountant-General of the Navy from the Administration controlling and operating the ships concerned, in accordance with the present system of collecting charges for W/T commercial messages.

The accuracy with which bearings can be taken depends on certain conditions already referred to, but although the bearings given by a station within the section over which it is designed to work can generally be considered accurate to within two degrees, it must be distinctly understood that the Admiralty provide this service on the express condition that they incur no liability for any consequences resulting directly or indirectly from any inaccuracy in the bearings given, from any failure in the service, or from any other cause whatever.

(Notice No. 952 of 1920.)

AIR MINISTRY NOTICE TO AIRMEN,

No. 103, DATED SEPTEMBER 30TH, 1920.

ROYAL NAVY WIRELESS DIRECTION FINDING STATIONS.

It is hereby notified:—

1. Aircraft may use the Wireless Direction Finding Stations operated by the Royal Navy, under the conditions laid down for the use of these stations by the Mercantile Marine, in Admiralty "Notice to Mariners," No. 524, of March 25th, 1920.

Note.—(a) Rhyl is not fitted with transmitting apparatus, and is controlled by Amlwch.

(b) Seaview has no transmitting apparatus, and is controlled by Malin Head (GMH), which keeps watch on 600 metres.

2. The actual procedure to be adopted by aircraft requiring bearings will depend upon what stations are concerned. It should be observed that if the stations to be called do not all keep watch on the same wave (e.g., Lizard and Carnsore), they should be called up together, and the bearings taken in one operation. If, however, two or more stations are linked by special land lines (e.g., Amlwch and Rhyl) only one of them should be called up. In such cases, however, the aircraft must specify in the preliminary signal the D.F. stations which are required to supply bearings.

3. The following abbreviations are to be used:—

Signal.	Meaning.
QTE? ..	"What is my true bearing from you (or from —)?"
QTE ..	"Your true bearing from me (or from —) was — degree."

4. The aircraft calls the station or stations, on the appropriate wave, making "QTE?" in conjunction, if necessary, with the call signals of the stations from which bearings are required; and also (if the call is NOT made on 450 metres) by the figures "450," signifying that the aircraft will shift to 450 metres for the taking of the bearing. The aircraft then awaits instructions.

Example 1.

An aircraft whose call signal is XYZ requires bearings from Amlwch (BXV) and Rhyl (BZW).

The aircraft, having first shifted to 450 metres, calls Amlwch thus:—

CT BXV BXV de XYZ QTE BXV BZW?
The aircraft then awaits instructions.

Example 2.

The aircraft requires a bearing from Seaview (BXK). The aircraft has to use 600 metres to call Malin Head (GMH).

The aircraft calls on 600 metres, thus:—
CT GMH GMH de XYZ QTE BXK? 450
The aircraft then gets ready to shift to 450 metres and awaits instructions.

5. The station or stations called then make the necessary arrangements, and, when ready, answer in alphabetical order of their call signals (if more than one was originally called), and make "K" (go on) preceded by "450" if 450 had been made in the original call.

Example 1.

Amlwch, in Example 1 above, warns Rhyl by land line, and, when both are ready, makes on 450 metres:—

CT XYZ de BXV K.

Example 2.

Malin Head, in Example 2 above, warns Seaview by land line and then makes on 600 metres:—

CT XYZ de GMH 450 K.

Malin Head then shifts to 450 metres, so as to be ready to give the result when received by wire from Seaview.

6. On receiving "K," the aircraft, having shifted transmitting wave to 450 metres (if not already done), then makes her own call signal for 45 seconds, and awaits the result.

Example 1.

The aircraft, in Example 1, para. 4, makes on 450 metres:—

CT BXV de XYZ XYZ CYZ, etc. (for 45 seconds) XYZ.

Example 2.

The same as Example 1, reading GMH for BXV.

7. The station or stations then reply (in alphabetical order if more than one) either asking the aircraft to repeat (?) or giving the result. The result is given by the signal QTE, followed, as necessary, by the call signal and by a group of three figures (000 to 359) indicating the true bearing from 0° to 359° of the aircraft from the station. Several bearings can be combined into one message, each bearing immediately following the call signal of the station which took it. The time of handing in is always expressed in Greenwich mean time for all messages giving bearings to aircraft.

Example 1.

Rhyl, in Example 1 above, is not satisfied with the bearing and informs Amlwch. Amlwch makes on 450 metres:—

CT XYZ de BXV ?

The aircraft at once complies by making on 450 metres:—

CT XYZ de XYZ XYZ XYZ, etc. (for 45 seconds) XYZ.

Rhyl is then satisfied that the bearing is 340° and informs Amlwch, while Amlwch finds that its own result is 37°. Amlwch therefore makes on 450 metres:—

CT XYZ XYZ de BXV 1 9.45 M (time)
=QTE BZW 340 BXV 037+BXV.

Example 2.

Seaview, in Example 2 above, gets a satisfactory bearing of 329° and informs Malin Head. The latter makes on 450 metres:—

CT XYZ XYZ de GMH 2 10.46 S (time)
=QTW BKK 329+GMH.

Example 3.

Had the aircraft merely asked Lizard (BVY for a bearing, Lizard, finding it to be 246° would make on 450 metres:—

CT XYZ XYZ de BVY 1 7.6 M (time)
=QTE 246+BVY.

8. The aircraft, on receiving the result, acknowledges receipt in the ordinary way, and makes the "end of work" sign. This sign is then repeated by the stations concerned. It is important that the "end of work" sign should not be omitted, since it not only indicates that the operation is finished, but it also shows that all concerned are about to resume watch on their normal wave.

9. Further information on this subject is contained in Admiralty "Notices to Mariners," Nos. 363 of February 25th, 1920; 524 of March 25th, 1920; and 838 of May 22nd, 1920, which should be consulted.

By Command of the Air Council,

W. F. NICHOLSON.

Air Ministry, London, W.C. 2,

September 30th, 1920.

ITALY

Vessels wishing to obtain bearings from a D.F. station must call up the control station, and the latter, having obtained the required information, will duly transmit it to them. The bearings are true, and are given in degrees from 000° to 359°.

The procedure is as follows:—

A ship whose call signal is ABC wishes a bearing.

On a wave of 600 metres she will signal:—

CT ICZ ICZ de ABC QTE ?

The D.F. control station will answer:—

CT ABC de ICZ AS.

The control station then wires the D.F. station and when ready replies:—

CT ABC de ICZ K 6.

ABC after 30 seconds signals:—

CT ICZ de ABC ABC ABC, etc., for 45 seconds.

If dissatisfied with the bearing, the D.F. station, through the control station, will ask the ship to repeat.

Control station signals:—

CT ABC de ICZ UD.

ABC repeats the signal as given above.

When satisfied with the bearing (which in the case of Murano is assumed to be 170°, at 9.45), the D.F. station will wire it to the control station, whence it is passed to the ship as follows:—

CT ABC de ICZ de IRM 9.45 M BT QTE
170 AR ICZ.

ABC acknowledges receipt:—

CT ICZ de ABC R SK.

A charge of six francs is made for each bearing transmitted by an Italian W/T D.F. station. The charges are collected in the same manner as for wireless telegrams originating from ships.

NEWFOUNDLAND AND LABRADOR

(See under CANADA)

NORWAY

FIVE Norwegian coast stations are equipped with direction finding apparatus of the Marconi type. One of them will, in the near future, be opened for official use. The wavelength to be employed is 600 metres.

Two radio-beacons are in course of construction, one at Marstenen (the entrance of the port of Bergen), and one at Faerder (the entrance of the Kristiania Fjord). The wavelength to be used is 1,000 metres.

SWEDEN

A vessel which requires a bearing should call up the control station, on a wavelength of 600 metres, and send the signal:—

"QTE? = What is my true bearing from ?"

The vessel should then await instructions while the requisite information is being obtained by the control station, which will signal the result of the observations by sending:—

"QTE = Your true bearing from SAL was degrees."

The bearing is given by a group of three figures from 000 to 359, corresponding to 000° (North) to 359°

Immediately the information has been received the vessel should acknowledge the receipt in the usual manner, concluding with the "end of work" sign, which will be repeated by the control station.

Until further Notice the bearings will be transmitted free of charge.

Although every care will be taken to ensure the accuracy of the bearings transmitted, the Swedish authorities accept no responsibility whatever for damage incurred, either directly or indirectly, through any inaccuracy, or from any other cause.

In order that the operations of the D.F. station may be checked, mariners are requested to forward to Kungl. Telegrafstyrelsens Radiobyra, Stockholm 2, a brief report, giving the results of observations thus obtained.

- (a) Vessel's name.
- (b) Radio compass station's name.
- (c) Date and time (G.M.T.) when vessel received bearing.
- (d) Bearing given by radio compass station.
- (e) Vessel's position when bearing was received, determined in some other manner.
- (f) The probable accuracy of the calculated position.
- (g) Weather conditions at the time.
- (h) Eventual remarks.
- (i) Captain's or observer's signature.

UNITED STATES OF AMERICA

Acts and laws affecting direction finding are to be found under U.S.A. in the Laws and Regulations Section.

THE most recent and probably the most valuable aids to navigation in a fog are the radio compass stations.

While the use of these radio bearings should not lead a mariner to neglect other precautions, such as the use of the lead, etc., during a fog, these bearings will greatly reduce the dangers to navigation for mariners who are compelled for any reason to proceed during foggy or misty weather.

These radio compass stations are provided primarily to assist the mariner in closing the land during fog or poor visibility, but they may also be used to obtain the positions of vessels at sea in radio compass range, about 150 miles, when for any reason positions cannot be obtained by other means.

The maximum distance for which bearings from these stations are accurate is 150 miles. But accurate positions cannot be plotted when more than 50 miles from the shore on Mercator charts, for the Mercator projection introduces a distortion of the true bearing. Charts based on the Gnomonic projection are essential to plot correctly long-distance radio bearings.

Such charts are now under construction by the Hydrographic Office; until they are available mariners may use the Mercator chart for long distance bearings, applying necessary corrections which may be obtained by various methods, one of which is fully explained on the backs of H. O. Pilot Charts of the North Atlantic Ocean for February, 1921; North Pacific Ocean for May, 1921; Indian Ocean for June, 1921; and Central American Waters, for March, 1921.

Radio Compass Stations are divided into two classes:

(a) Single stations, operating independently and furnishing a single bearing. These stations are located with the view of giving service to ships at a distance of not over 150 miles from the station.

(b) Harbour entrance groups. All stations in harbour entrance groups are connected to and controlled by the master station; all stations of the group take bearings simultaneously and these bearings are transmitted to the ship requesting them by the control station. The purpose of these stations is to lead mariners to the light vessels off harbour entrances.

Where only one radio compass station is available, the mariner may fix his position by two or more bearings from the station with the distance run between, or may use the bearing as a line of position, or as a danger bearing. Or the bearing may be crossed with a line of position obtained from an observation of an astronomical body to establish a fix.

The following instructions have been issued by the United States Naval Communication Service concerning the W/T D.F. stations maintained by them:—

The U.S. Naval Communication Service will furnish bearings to all vessels equipped with W/T transmitters.

Wavelengths.—All independent and group D.F. stations keep watch on 800 metres. Only this wave should be used to call and work with the stations.

Calling a W/T D.F. station.—To obtain a bearing from independent stations, call the station from which the bearing is desired in the usual manner and request bearings by means of the conventional signal given below. Simultaneous bearings from two or more stations can be obtained by making the call include the other stations desired.

To obtain bearings from the harbour entrance stations carry out the procedure previously given. The Control Station only will answer.

Conventional signals.—The following signals will be used:—

Signal.	Meaning.
QTE ?	What is my true bearing?
QTE	Your true bearing is _____ degrees from D.F. station.

DETAILS.

(a) A ship calling the D.F. station or D.F. Control Station should make the abbreviation "QTE ?" This request will be answered by the station or Control Station, and when ready to observe the bearing it will send the signal "K," indicating to the ship to repeat its distinguishing signal for a period of 50 seconds. The signal should be made slowly with the dashes considerably prolonged.

(b) The testing should be made on 800 metres, upon the completion of which the ship should await reply from the D.F. station.

(c) The station or Control Station will then reply, repeating the signal "QTE," followed by the bearing in degrees given by a group of three figures 000 to 359, indicating the true bearing in degrees of the ship station from the D.F. station, and then the time group giving the time of observations in local Standard Time. In the case of more than one D.F. station connected by land line only, the station originally called will answer. This station will combine all the bearings taken by itself and associated station into one message, which gives each bearing observed immediately after the name of the station making the observation.

All D.F. stations transmit on 800 metres.

EXAMPLE.

A ship (call letters KVA) desires to get bearings from the Delaware Bay entrance group (call letters NSD). The following procedure is used:—

```

- - - - - NSD NSD NSD - - - - - KVA
KVA KVA - - - - - QTE - - - - - AR
- - - - - KVA - - - - - NSD K.
- - - - - NSD - - - - - KVA
- - - - - QTE - - - - - KVA KVA
KVA (making call letters for KVA for 50 seconds
prolonging the dashes) - - - - - KVA AR
- - - - - KVA - - - - - NSD
- - - - - QTE
Cape May 120 Cape Henlopen 110 Bethany
Beach 085 at 0126 - - - - - NSD AR
- - - - - NSD - - - - - KVA
- - - - - 120 110 085 at 0126 - - - - -
AR
- - - - - KVA - - - - - NSD R
- - - - - NSD

```

This method is the only authorised procedure for obtaining the bearings and should be followed exactly. Such signals as MO = V = and other test signals are not authorised for D.F. work. The testing period of 50 seconds should not be exceeded.

Mariners who do not follow the prescribed procedure exactly occasion delay to themselves in obtaining bearings, and to others who may be waiting for an opportunity to use the stations.

Danger from reciprocal bearings.—Attention is invited to the fact that when a single bearing is furnished there is a possibility of an error of approximately 180°, as the D.F. station cannot always determine on which side of the station the vessel lies. Certain stations, particularly those on islands or extended capes, are equipped to furnish two corrected true bearings for any observation. Such bearings when furnished vessels may differ by approximately 180°, and whichever bearing is suitable should be used.

Caution.—Mariners receiving bearings which are evidently the approximate reciprocal of the correct bearing should never attempt to correct these bearings by applying a correction of 180° as such correction would not include the correction necessary on account of deviation at the D.F. station.

An error of as large as 030° may be introduced by applying an arbitrary correction of 180° to such bearings. Vessels receiving bearings manifestly requiring an approximate 180° correction should request the other bearing from the D.F. station if not previously furnished.

Bearings, except in the case of approximate reciprocal bearings, should be accurate within 002° of arc provided the ship's W/T transmitting equipment is tuned sharply to 800 metres. Operators should use sufficiently wide coupling to obtain low decrement. If transmitters are not tuned sharply it is difficult to obtain bearings that are sufficiently accurate for navigational purposes.

When bearings from three or more D.F. stations are not over 002° of arc in error, but do not meet at a fixed point, the geometrical centre of the triangle formed by the bearings can generally be taken as the approximate position of the vessel.

Mariners until thoroughly familiar with the system are advised to use the D.F. stations frequently, especially in clear weather when positions of vessels can be accurately fixed, in order to accustom operators to the procedure and to acquaint themselves with the degree of accuracy and dependability of bearings furnished by the stations.

Reports.—In order that the operation of the D.F. stations may be checked, mariners obtaining bearings are requested to forward a brief report to the Director, Naval Communications, Navy Department, Washington, D.C., U.S.A., containing the following particulars:—

1. Name of ship.
2. Name of D.F. station.
3. Date and local Standard time at which D.F. bearing was taken.
4. Bearing given by D.F. station.
5. Estimated position of ship at above time and dates by methods other than W/T.
6. The probable degree of accuracy of the estimated position.
7. Weather conditions at above time.
8. Remarks, if any.
9. Signature of master or responsible navigating officer.

There is no change for bearings furnished by the U.S. Naval W/T D.F. Stations.

INFORMATION WITH REGARD TO BEARINGS

The Director, U.S. Naval Communication, states that considerable difficulty is being experienced with merchant ships asking for D.F. bearings on very broad tunes, and that "bearings obtained by wireless should be accurate within 2 degrees, provided that the transmitting equipment on board vessels is tuned sharply to 800 metres. Wireless operators are cautioned to use sufficiently wide coupling to obtain low decrement. If transmitters are not tuned sharply it is difficult to obtain bearings that are sufficiently accurate for navigational purposes."

Masters of vessels are advised to use the D.F. stations frequently, particularly in clear weather and when the vessel's position is definitely fixed in order that the degree of accuracy and dependability of the wireless compass may be established.

Masters of vessels are invited to make use of the U.S. naval radio compass (direction finding) stations to fix positions. They will be found especially useful during thick weather.

The following U.S. naval shore radio compass stations are now in operation for the purpose of furnishing bearings in the Western Atlantic and the Gulf of Mexico. For the present there will be no charge for bearings furnished.

RADIO COMPASS STATIONS ON ATLANTIC AND PACIFIC COASTS ALPHABETICALLY BY NAMES OF STATIONS.

U.S. PACIFIC COAST.

The following stations on the Pacific Coast are completed and in commission to give continuous service to shipping :—

PACIFIC COAST.

Name of Station.	Call Signal.	Name of Station.	Call Signal.
Bird Island, Calif.	NLD	Point Arguello, Calif.	NPK
Cape Hichenbrook, Alaska	NRM	Point Fermin, Calif.	NPX
Cattle Point, Wash.	NFN	Point Hueneme, Calif.	NMD
Empire Oreg.	NPF	Point Loma, Calif.	NPL
Eureka, Calif.	NPW	Point Montara, Calif.	NLH
Farallons Island, Calif.	NPI	Point Reyes, Calif.	NLG
Fort Stevens, Oreg.	NPE	Port Angeles, Wash.	NFT
Imperial Beach, Calif.	NPL	Smith Island, Wash.	NFH
New Dungeness, Wash.	NFT	Soapstone Point, Alaska	NUW
Ocean Park, Wash.	NPE	Tatoosh, Wash.	NPD

Masters of ships are informed that in making use of the San Francisco Harbour entrance group they are requested to call the Farallon Island Station, who will obtain bearings from the remaining stations in the group and furnish them to the ship, after corrections have been applied.

ACCURACY OF RADIO BEARINGS.

The following information was furnished by the Director of the U.S. Naval Communication Service under date of October 10th, 1919 :—

"The reliance that can be placed in bearings

furnished by shore radio compass stations will be governed by the following conditions :—

"(a) When two sets of bearings are received which do not agree, a third set should immediately be requested.

"(b) In thick weather, bearings should be requested at least every half-hour.

"(c) Bearings that pass over intervening land or that are tangent to the shore line are not as reliable as those that have a clear sweep over the sea.

"(d) Navigators receiving a set of bearings should immediately investigate the approximate fix indicated and determine whether or not they are being furnished with bearings from the stations that should be most reliable.

"(e) When the position of the ship as indicated by the radio bearing differs materially from the position of dead reckoning, a second set of radio bearings should be requested in order to check the first radio position."

NOTE.—While the Navy Department states that at the present time radio compass bearings have reached a high degree of accuracy, it must be understood that the Government incurs no liability for any consequences resulting from any inaccuracy in the taking or transmission of radio compass bearings. These bearings are provided free of charge, as aids to navigation, to be used at the discretion of the master of the vessel.

Radio Compass Stations—Calibrated Arcs of.

Bearings are only reliable in the arcs of the circle for which stations have been calibrated.

Stations.	Arc of Calibration.
Empire*	230-360 (true).
Fort Stevens†	185-295 (true).
Ocean Park‡	205-345 (true).
Tatoosh	230-90 (true), clockwise
New Dungeness†	255-95 (true), clockwise
Smith Island‡	0-360 (true), complete circle.
Cattle Point‡	130-275 (true), clockwise
Soapstone Point‡	253-50 (true), clockwise
Cape Hinchinbrook‡	112-294 (true), clockwise

* Not in commission.

† In commission for continuous service.

‡ Limited commission available for bearings during foggy weather.

Note.—All of the above sectors must be understood as being of the circle of which the compass coil is at the centre, and are observed from the listed position of the compass stations.

RECENT PROGRESS IN HIGH SPEED WIRELESS TELEGRAPHY.

By G. M. WRIGHT.

IN looking over the work which has been done recently in the development of the art of reception in Wireless Telegraphy, one is most impressed by the notable absence of proposals for circuits, etc., having for their object the complete elimination of atmospherics. The decade prior to the War produced a multitudinous array of "X stoppers"—a good number of which appeared to rest on solid facts—but our increasing knowledge of the subject has gradually enabled us to understand the fundamental fallacies involved. An interesting case is that of "balancing out" atmospherics. In this arrangement two circuits are arranged in such a manner that whereas one is receiving both signals and X's, the other is receiving X's alone. If then the second circuit is arranged so that its effect on the ultimate receiver (recorder or telephone) subtracts from the effect due to first, it would appear that the X's should vanish leaving the signal undisturbed. It has, however, been shown that no such balance can exist even in the most plausible case when the power from one circuit is balanced against the power from the second. The destruction of the "balance" theory has done much to cripple the resources of the devisers of X stopping circuits, who seemed to have turned their attentions to the problem of patenting all the available combinations of capacity inductance and resistance with the three electrodes of a valve.

Under these circumstances progress has mainly consisted in:—

- (1) The development of directional receiving aerials.
- (2) The scientific application of tuning (band filters, etc.).
- (3) The attainment of a continuous wave transmitter which will radiate a wave of constant frequency.
- (4) The evolution of circuits which will possess certain desired characteristics and at the same time be practicable.

The most potent weapon we have to use against X's is that provided by directional receiving systems. Take the case of the reception of signals from New York in England. The direction from which the signals are arriving lies a little North of West (the bearing of the high-power station on Long Island is N. 288 E. at London). On the other hand the predominating direction of atmospherics in England is between South and South-East. Consequently any aerial system which possesses the property of unidirectional reception will at once give a marked improvement in the readability of the American signals, for we can direct the "blind eye" of the system to the atmospherics and at the same time retain New York in a sector having good receiving properties. This is a most valuable asset and it is very fortunate for Transatlantic working that Nature has arranged the X direction in this manner. Even if atmospherics are arriving more or less uniformly from all directions a unidirectional receiver will give an advantage, since X's arriving from the sector of low receiving power do not disturb the circuits or are weakened, and consequently the total number of X's received is reduced.

Directional reception has received considerable attention in England, and C. S. Franklin has worked out a system of spaced frame aerials with very definite directional properties. In this system the directional effect is obtained by making use of the fact that the E.M.F.'s induced in two aerials spaced a fraction of a wavelength apart and geographically lying in the direction of the transmitting station differ in phase. This phase difference is simply due to the fact that the arriving wave strikes the aerial nearest to the transmitter prior to its arrival at the most distant aerial, and consequently the

E.M.F. in the nearest aerial has a leading phase relative to that in the other aerial. By combining the currents due to these E.M.F.'s in a common circuit, in conjunction with additional controllable phase shifts introduced by the circuits themselves, a variety of polar curves of reception can be produced. Fig. 1. is an example of a characteristic diagram obtained in this manner. It will be observed that there are three completely blind spots, at 90° , 180° and 270° from the maximum direction of reception, and that in the 90 - 180° and 180 - 270° sectors the receiving power is relatively small. In fact we may say that from 80 - 280° the receiving power is low generally and in three directions in this sector it is zero. It will be readily understood that such a polar curve of reception will give a very marked reduction in the X intensity when receiving American signals in England on account of the large difference in azimuth between the arriving signals and the prevailing atmospherics. The advantage to be gained from a carefully adjusted polar curve is most remarkable. Signals may be so badly mutilated by X's when received on a plain open aerial, as to be unreadable, when the substitution of a system with a correct polar curve at once makes the ratio of signal to X intensities sufficiently favourable for fast working. A very large number of polar curves of reception for various combinations of multiple spaced aerals (both frame and open aerals) have been worked out theoretically.

Fig. 1.

The subject is nevertheless by no means exhausted and it is known that the angle of reception may be made as narrow as we please by extending the territory covered by the aerial systems. This area covered is very large for sharp diagrams and the difficulty of combining the currents becomes so great as to render the scheme almost impracticable. It seems therefore that future development will lie in the direction of improvement in the methods of combinations of aerals, together with the determination of the most economical way of placing the aerals for the best polar curve.

In America work is also being carried out on directional reception, and H.H. Beverage has devised a type of aerial which makes use of transmission phenomena in a novel manner. The aerial consists of a low horizontal wire lying in the direction of the arriving waves and earthed at the end nearest to the transmitting station through a resistance. This resistance is of such a value that no reflection of an electric wave along the wire can occur from the earthed end. The aerial is very long, being generally about equal in length to the wavelength of the received signal. Owing to the resistance of the earth or sea over which electromagnetic waves must travel the wave

front is tilted forwards. This tilt gives a small horizontal component to the electric force in the wave lying in the direction of propagation. If then such an electromagnetic wave is incident on one end of a long wire lying in the direction of propagation, the horizontal component of the electric force in the wave will induce an E.M.F. (and consequently a current) in the end portion of the wire. The disturbance will immediately be propagated along the wire with a velocity nearly equal to that of light, and therefore as the wave in the ether moves along it will be accompanied by the current wave set up when it first encountered the end of the wire. Now the rate of flow of energy from the field of the wave to the wire is equal to the product of the applied E.M.F. and the current at the place under consideration. Under these circumstances it can be seen that the current will steadily increase as the wave proceeds along the wire, since both the wave in the conductor and the wave in the ether have nearly the same velocity. If, however, the ether wave is incident at an angle relative to the direction of the wire, then the phase angle between the current in the aerial and the applied E.M.F. will change as the disturbance moves and the additive effect will not be so marked. This change in phase, which varies very rapidly with the angle of incidence, results in a pronounced directional diagram.

It was stated that one end of the wire is earthed through a terminal resistance of such a value that no reflection of the wave can occur. In Fig. 2 consider a wave incident in the direction B to A. A small E.M.F. is set up by the horizontal electric field in the ether wave at B, the resulting disturbance passes along the wire together with the ether wave and continues to grow in intensity until its arrival at A. Owing to the presence of the terminal

Fig. 2.

resistance no reflection can occur and consequently the energy in the conductor wave is dissipated as heat in the resistance. The end B is shown connected to the grid of a three electrode valve, and therefore the plate current of this valve will be a function of the potential of B and can be used to operate the receiving circuits. Under the conditions just stated (*i.e.* wave from B to A) practically no change in potential will occur at B and therefore no signal will be received. Now consider the case of the ether wave travelling in the direction A to B. The additive effect will again occur and on arrival of the conductor wave at B it will be reflected and a potential will be set up which will operate the receiving circuits. The reflected wave travels back along the wire and re-reflection is prevented by the resistance. It will thus be seen that the aerial, besides being fairly sharply directive also is unidirectional. A polar diagram of the receiving power of such an arrangement is shown in Fig. 3. In practice the circuit is not quite so simple since means are adopted to bring the resistance at A to the receiving end B in order that it may be adjusted at the receiving station. The diagram of Fig. 3 is that given by a wire one wavelength long, and it will be observed that although the diagram is good, nevertheless there is a certain receiving power at the back. It is possible to reduce the area of the back loop and means are usually adopted in practice to do so.

Fig. 3.

The well-known cardioid (Fig. 4) polar diagram given by the combination of a frame and open aerial is also very effective in dealing with directional atmospherics. An advance has been made in the means for combining the aeralis which improves the directivity for X's. For the purpose of balancing, the usual method employed was to adjust the phases of the currents flowing in the frame and open aeralis by suitable mistuning of the circuits. Any such adjustment can be critically exact for one frequency only, and the departure from a true balance for a small change in applied frequency is very considerable if the dampings of the circuits be small. In the modern method the phase adjustment is obtained by the use of a so-called "aperiodic" radiogoniometer, and vertical aerial being very heavily damped by an added series resistance. It is not necessary to enter into details here, but it is obvious that at the minimum the relative phases of the currents in the two aeralis will remain substantially constant over a broad band of frequencies, since the aeralis are nearly aperiodic. Since an X-pulse can be analysed into a spectrum of frequencies, the balance for X's is better than that given by the mistuning method.

Fig. 4.

The second method of attack on the X problem has lain in the careful development of tuning or filter circuits. If a signal is sent by means of a continuous wave of perfectly steady frequency, then it is theoretically possible to eliminate all atmospherics by narrowing down the band covered by the

resonance curve of the receiving circuit until all frequencies except that of the transmitter are filtered out. Although it is possible to approach near to this ideal in practice, nevertheless, such a receiver would be quite useless since, for reasons which will be made clear, the speed of sending would fall to zero.

Intelligence is conveyed from the transmitter to the receiver by modulation of the continuous wave ("carrier wave") emitted by the former. This modulation is performed in telephony by the voice, in telegraphy by a key or automatic sender of some kind. It can be shown that any such modulation has the effect of producing a series of side waves differing in frequency from the fundamental or carrier wave. The frequencies and intensities of these side waves are governed by the frequencies and intensities of the components in the modulation. Take the case of a carrier wave modulated, by means of an automatic sender, by square dots at a frequency of 50 per second. Now a sequence of square dots can be resolved into a series of sine waves of the following nature:—

$$\sin pt + \frac{1}{3} \sin 3pt + \frac{1}{5} \sin 5pt + \frac{1}{7} \sin 7pt + \dots$$

where n is the fundamental frequency of the dots and $p = 2\pi n$. It can also be shown that if a carrier wave of frequency p is modulated by a sine wave of frequency q then in the composite wave there exist the frequencies $(p - q)$, p and $(p + q)$ forming the so-called "side bands" of a modulated carrier wave. Now in the case of our modulation by square dots at 50 per sec., from the series given above the side waves composing the modulation frequency, must have frequencies of 50, 150, 250, 350 and so on. And since the carrier wave is modulated by all these frequencies; if we suppose the carrier frequency to be 50,000 (6,000 metres wavelength) then the complete band will be:—

..... 49650 : 49750 : 49850 : 49950 : 50000 : 50050 : 50150 : 50250 : 50350, etc., and therefore if the ideally square formation is to be preserved in the received signals, then the resonance curve must be wide enough to embrace all these frequencies produced by modulation. Narrowing down the band covered by the receiving filters produces a rounding off of the corners of the square dots by removing the higher component frequencies in the modulation. This rounding is the essential factor which imposes a limit on the amount of filtering which is allowable in the receiving circuits.

The tendency therefore in a modern automatic receiver is to provide a filter having a resonance band of such a width that at a given speed of working the signals are just sufficiently clear cut to be readily transcribed. When this state of affairs exists, then the maximum reduction of atmospherics is obtained. It is also apparent that the amount of this reduction is dependent upon the speed of working; the slower the speed, the narrower the permissible band to give readability and consequently the greater the weakening of interference from X's. It can be shown that the least rounding of the Morse signals for a given filtering out of X's is produced by a filter having a resonance curve approximating to a square topped band with nearly vertical sides falling sharply to zero. Development has therefore been more or less constrained to the evolution of a filter system which will give the required square band. It is also essential to have the width of the band readily adjustable, since the width controls the speed of working. When conditions improve the decreased intensity of atmospherics allows the band to be opened out and the speed of sending to be raised at the transmitter.

In America work has been done with the object of developing a band filter on the lines of an artificial line. Such a line can be constructed which attenuates all frequencies lying on either side of a certain band very rapidly.

A series of tuned oscillatory circuits in cascade, coupled by means of valves, can also be constructed to give a fairly square resonance curve. Work has been done in England on this idea, resulting in the development of a practical filter system which is at present in use on the Continental and Transatlantic stations of the Marconi Company.

It is important to notice that there is no fundamental difference in the result whether the filtering takes place before or after heterodyning. The only difference is that the equivalent width of band of a beat tone filter is narrowed by the change of frequency when viewed from the standpoint of the original high frequency arriving wave. Consider for instance a wave of 3,000 metres, corresponding to a frequency of 100,000 cycles. If we decide that the band to be covered by the receiver is 100 cycles wide, then a change of 50 cycles per second on either side of the point of resonance must cause a reduction of the received current to a negligible value. If this result is to be obtained by high frequency filtering only, then the band must be so narrow that a change of only 0.05 per cent. results in a complete cut-off. A set of filter circuits to give such a close tuning must necessarily involve a considerable expenditure in stranded copper wire. If, however, the original 3,000 metres wave be heterodyned to give a beat tone of say 2,000 frequency, and the filter be applied to this beat tone then the band must extend over $2,000 \pm 50$ frequency. In this case a change of ± 2.5 per cent. must give a complete cut-off. Such a circuit is obviously more easily constructed. Under these circumstances filtering of the beat tone current is more generally employed. It should, however, be remembered that the heterodyne will give a double beat tone with X's. Those frequencies in the atmospheric pulse which lie both above and below the heterodyne frequency by the required amount will give a beat tone lying in the band of the low frequency filters. Therefore for the best reduction of atmospherics it is necessary in any case to make the band of the high frequency circuits narrow enough to eliminate the second set of X frequencies which would otherwise affect the recorder.

It will be apparent from the foregoing that the success of any band filter system depends entirely upon the emission of a wave of very constant frequency by the transmitting station. Much work has been done in connection with this problem, which presents considerable difficulty in the case of a high frequency alternator. For example, it is necessary to keep the speed of the machine giving a 15,000 metre wavelength so accurately controlled that a frequency variation of 0.1 per cent. shall never occur. Difficult as it may appear, practical means have been developed for very accurate speed control allowing of the use of filters in reception. The whole question, has, however, been very much simplified by the development of the valve transmitter. The simplest type of valve transmitter consists of a bank of three electrode valves controlling the energy supplied to a tuned aerial from a source of high voltage. In such a case the frequency of the pulses applied to the aerial is governed by the frequency of the aerial itself, since the aerial current is made to apply the high frequency controlling voltage to the grids of the transmitting valves. Consequently any variation in the natural period of the aerial circuit will reflect themselves in corresponding variations in the length of the emitted waves. If, however, the high frequency alternating voltage on the grids is controlled by means of a master oscillator instead of by the aerial current, then variations of the natural period of the aerial circuit can no longer effect the frequency of the wave. In this way, the wavelength may be entirely governed by oscillations in a closed circuit, which are extremely constant in frequency and a steadiness can be attained which is all that can be desired from the point of view of the receiver.

The subject of keying the transmitter has also received its share of attention. In America, the development of the magnetic amplifier has simplified the problem, which had hitherto been approached by the use of various types of high speed switch operating in the main power supply to the transmitter. Such switches were either operated by powerful solenoids or by compressed air engines. The use of the magnetic amplifier in connection with high frequency alternators has resulted in a big reduction in the size and an increase in the reliability of the keying apparatus. The keying problem has also been cleared up by the before-mentioned use of a master oscillator

to control a high power valve transmitter. In this case the key may operate on the master oscillator which is of comparatively small power. By this means the control of the power radiated by a high power transatlantic station is provided by a small relay such as is used on normal telegraph lines.

The advances in the art have resulted in a complete change in the whole method of operating wireless circuits. It is now possible to relay the received signals to an ordinary telegraph line and so to dispense with the operating staff which was formerly a necessity for manual retransmission from the receiving station to the point of distribution of the received messages. In the same way the advances made in keying have made it possible to control a distant transmitter reliably from a central office, and no operators are necessary at the transmitting station. In this way all the services of the Marconi Company, both Continental and Transatlantic, are operated direct from London via landlines to the transmitting and receiving stations. The speed of working has also risen very much and this rise has brought in its train the need for keyboard perforators and on Continental services, type-printing receivers.

The whole atmosphere of a wireless telegraph office now resembles that of a landline telegraph office, and wireless services are able to compete with line telegraphs not only from the point of view of lower cost per word, but are also able to offer an equal rapidity of service. Until recently the factor controlling the speed of working was that intangible, but nevertheless very real, quantity known as "conditions." It is satisfactory to note that the speed is now nearly entirely governed by the volume of traffic to be handled.

AERIALS.

By T. L. ECKERSLEY.

THE recent development of aerials has been so extensive that it is hardly possible, in the course of a short article, to do justice to all its aspects. I therefore propose to deal with the subject from the electrical point of view rather than from the mechanical, which is a large subject in itself.

An aerial may be designed (a) for the purpose of sending signals of the required strength to one or more known stations or (b) for the purpose of receiving them. The conditions required in the two cases are very different, and it will be well to consider them separately.

Let us first take the case of transmitting aerials, these being perhaps the most important on account of their necessary size.

The erection of a modern high-power aerial system is a very considerable undertaking, and one that warrants a very careful consideration of all the factors which make towards success. In the first place, it is necessary to ensure that sufficient energy is radiated, so that the signals received are strong enough to overcome all natural atmospheric disturbances. This is a matter of what may be called "radiogeography," and does not concern the designer further than in fixing for him the "ampere-metre" factor to which he must work. This factor is the quantity $\frac{h}{\lambda} \frac{I}{\lambda}$ where h is the effective height, I the transmitting current, and λ is the wavelength used. The energy radiated in watts is 1,580 times the square of this. It will be obvious from this formula that the greater the height, and the greater the current, the greater will be the energy radiated.

At present there is a natural limitation to the height of an aerial. Structures of more than 800 feet are found to be too costly and impracticable to use. Hence, when this limit is reached, it will only be possible to increase the "ampere-metres" of the station by increasing the current.

Again there is a natural limit to the amount of current that can be put into a given aerial structure, because the greater the current the greater becomes the maximum voltage on the aerial, according to the relation $I = 2 \pi \eta C V$, and it has not yet been found possible to make insulators which will stand more than about 120,000 volts in air under all weather conditions.

With this limiting voltage the current is proportional to the capacity of the aerial.

Hence, in order to obtain sufficient ampere-metres for long distance communication, it is necessary to put a large capacity as high as possible—not always an easy thing to do. For certain communications it may be necessary to have 0.1 mfd. at the height of 800, and this means that the aerial will have to be five or six miles in length.

If any genius discovered a method of raising the limiting voltage from 120,000 to 1,000,000 it would be possible to construct an aerial with approximately only one-tenth of the capacity to do the same work.

It is the aim of the designer to provide for as great a capacity at as great a height as possible, with, of course, a minimum number of masts. There is not very much choice in the matter. With a continuous aerial this condition is obtained when the aerial is spread out in a single straight line. The reasons for this may be illustrated by an example. Consider an aerial with a down lead and a long horizontal portion. There will be a certain maximum span allowable between the masts. Let the arrangement have the capacity C , then it is not difficult to show that no other arrangement could have so large a capacity. For instance, if the charged aerial were bent

at the middle mast into a V shape, and the two arms of the V could be brought gradually together, a certain amount of work would have to be done against the repelling force of the similar charges of the two limbs of the V, and the

energy of the system $\frac{1}{2} \frac{Q^2}{C}$ would increase. Since Q , the charge, is constant, C , the capacity, must decrease as the two limbs approach, and it is easy to see that the capacity is a maximum when the aerial is stretched out in a straight line.

In this argument the possibility of returning the end of the aerial on itself, and so reducing the number of masts by one, is not contemplated. This may be an economy in certain cases. These considerations will all be modified, of course, in accordance with economical conditions in the buying of land for the site, etc. The directional properties of the proposed aerial would also have to be taken into account.

POWER REQUIRED.

So far the necessary power to produce the current required has not been considered. In the ideal case, of course, all the power supplied to the aerial would be employed as radiation. In actual practice this ideal condition is very far from being realised, especially on long wavelengths.

The total power consumed by the aerial is $R I^2$ where R is the resistance and I is the RMS current. R is made up of the radiation resistance, R_1 , and the dead loss R_2 . The ratio of the power radiated to the power lost is $\frac{R_1}{R_2}$, and the radiation efficiency of the aerial is $\frac{R_1}{R_1 + R_2}$. To produce the highest possible efficiency it is necessary to reduce the dead losses to a minimum. A great deal of ingenuity has been exercised on this problem, and many and various are the tentative solutions. Before discussing these, it is perhaps worth while emphasizing that the problem does not end with the reduction of the dead losses to insignificance, for even then only the very smallest fraction of the energy radiated has the good fortune to be received. Any device which increases the ratio of the energy received to that radiated, e.g., by directional methods, is a gain.

The problem of reducing the dead losses is already so difficult that the use of directional methods, especially on long waves, must be considered a dream of the future rather than a present day possibility. Far otherwise is it, however, in the case of reception, where directional effects are used to the fullest extent.

Certain general ideas with regard to aerial resistance may be useful as a preface to particular solutions of the resistance problem.

The wires of a big transmitting aerial are mainly horizontal, and the charging currents in these wires have their counterpart in the earth below, which completes the aerial circuit. The main loss being in these earth-return currents, the return path should be as short as possible. About 83 per cent. of this loss is comprised within a space below the aerial equal in breadth to twice the height of the aerial itself. If the height is doubled the return current is spread out over twice the breadth, and the loss is consequently halved, while the power radiated increases fourfold. The advantage of great height is therefore obvious.

A similar argument applies to almost any form of aerial, except a complete circular fan-shaped aerial.

Apart from these current losses, there are "potential" losses to be considered. These occur in any bad dielectrics which happen to be in the electrostatic field of the aerial. In general, they decrease, as the capacity of the aerial is increased, but with a fixed aerial they increase in proportion to the wavelength. These general ideas will make clear the methods by which various experimenters have attempted to overcome the resistance problem.

ALEXANDERSON METHOD.

Suppose we have a number N of similar small aerials, none of which is distant from any other more than a fraction of the wavelength employed, yet all of which are so far apart that the earth currents of any two do not overlap to any appreciable extent.

Suppose now that we produce currents of equal intensity and phase in all the aerials simultaneously, the total power loss of the system will be N times the power loss of a single aerial, while the total power radiated will be nearly N^2 times the power radiated by a single aerial.

The reason for this is clear. The electric and magnetic forces at a distance overlap and are almost entirely in phase, and are each N times the forces due to one aerial. Since the radiated power is proportional to the product of the electric and magnetic forces, it is proportional to N^2 . The ratio of radiation to total loss is therefore proportional to N .

The moral of this tale is that we can make the radiation efficiency as large as we please by multiplying the number of small stations within a restricted area.

The means which Dr. Alexanderson employs for obtaining these results are surprisingly simple. His aerial is really equivalent to a number of small T aerials set out in a line as in Fig. 1.

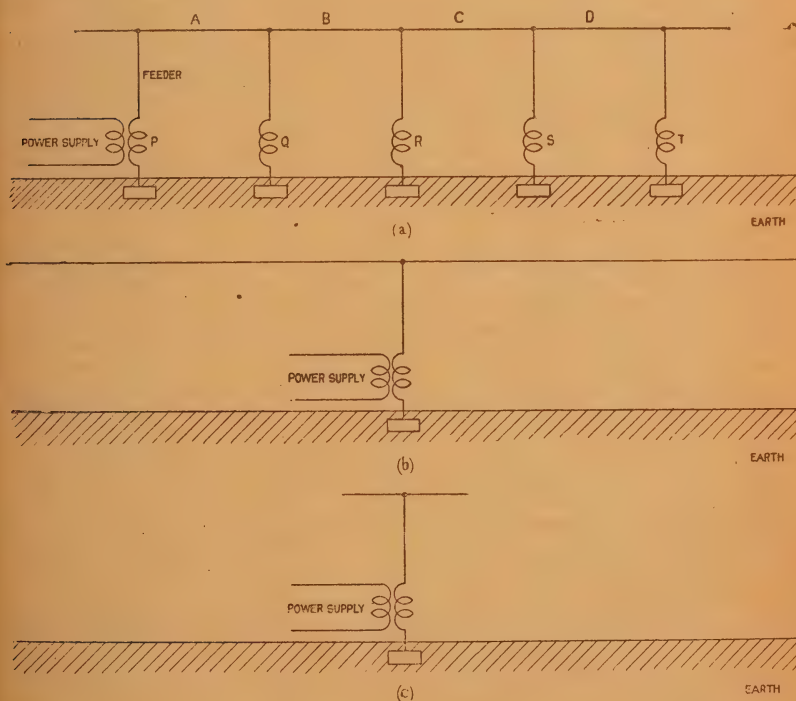

Fig. 1.

This arrangement has the merit of giving the maximum capacity. The aerials are joined together at the points A.B.C., etc., and are fed with power at any of the vertical "feeders." It is not difficult to see that the currents in the aerials P Q R S must be approximately of the same amplitude and phase, for if they were not so there would be a discontinuity of voltage at the joins A B C, which would set up a flow of current tending to equalise them.

In comparing the resistance of the sub-divided Alexanderson aerial (*a*) with the resistance of the same aerial with a single centre feeder (*b*), we must remember that the latter is approximately *N* times the resistance of a single one of the small T aerials (*c*), so that the resistance of (*a*) is roughly $\frac{1}{N^2}$ of the resistance of (*b*).

It might appear at first sight that there was no limit to this process of resistance reduction by sub-dividing, but in practice the limit is soon reached, for each sub-division, which decreases the individual capacity of the small T aerial (*c*) necessitates an increase of loading inductance, the added resistance of which outweighs the gain on subdividing.

The chief drawback to this system is that the losses which depend on the potential (*e.g.*, dielectric and leakage losses) are not reduced by sub-dividing. This is because the potential to which the upper capacity is raised is not changed by putting in the feeders. The total capacity is unaltered, as also is the total current, and it is obviously immaterial which way the total current is fed into the capacity—whether through a number of feeders or at one single point. The total current and capacity being the same in both cases, the voltage is also the same, and the dielectric and leakage losses, which depend on it, are likewise unchanged.

In spite of these drawbacks, very low resistances have been obtained by this method. I understand that the Alexanderson aerial in America have resistance between 0.3 and 0.5 ohms.

DR. MEISSNER'S METHOD.

Dr. Meissner has developed an interesting method of dealing with earth losses. The basic principle of this method is the feeding in of the current to the earth where it is wanted. To explain this more fully we may take refuge in an example and see how the idea may be applied to a radial type of aerial. If this aerial has a static charge, the charge and the electric force tend to distribute themselves in such a way that the electric energy is a minimum. When the aerial is oscillating on a wavelength long compared with its natural wavelength the distribution of electric force will also be determined by this rule. The dielectric current from earth to aerial, and *vice versa*, will also be distributed in this manner.

It will be seen from Fig. 2 that the maximum density of flow is near the outside edge of the aerial. In the usual method of earthing near the centre the currents have to flow through the earth from A to B before they return to the aerial by the path BC. Dr. Meissner, instead of earthing at A, feeds the current by a low resistance conductor into the earth in the neighbourhood of B, thus avoiding the long earth path A B. This idea is carried into practice in the following manner. The ground beneath the aerial is divided up into squares like a map, and a series of separate earths are planted in these squares. These are fed by separate cables from the centre. Chokes are placed in these leads so as to regulate the relative intensities of the currents, making them proportional to the number of lines of force which naturally fall in their respective squares.

The success of this method depends on employing feeders of low enough resistance.

DISTRIBUTION OF LINES OF FORCE

DISTRIBUTION OF TOTAL CURRENT

Fig. 2.

In common with the Alexanderson system, this method fails to eliminate, or even reduce, the "potential losses," *i.e.*, the dielectric and leakage losses at the surface of the earth.

A very similar system has been introduced at the large new trans-continental station at St. Assise, near Paris, and the total resistance of the aerial, which is of a T form, 3.2 km. long and 800 feet high, is about 0.67 ohms at 15,000 m. In this case the currents in the feeders are regulated by condensers instead of chokes.

THE EARTH SCREEN.

The Marconi Company has developed another method of reducing losses, by the use of what is technically known as an earth screen. This has been described fairly fully in the Proceedings of the Institution of Electrical Engineers (Vol. 60, p. 581). What I wish to emphasise here is the relation of this method to the two already described. The dead losses have been roughly divided into earth return current losses and potential losses, and it has been shown how the methods of Dr. Alexanderson and Dr. Meissner reduce the former without reducing the latter. The aim of the earth screen is to reduce *both* current and potential losses.

The screen, which forms the counterpoise of the aerial is placed between it and the earth, and intercepts the lines of force which would otherwise end on the earth. It consists essentially of a number of wires parallel to the horizontal part of the aerial covering the ground beneath it and extending beyond it and on either side for a distance at least equal to the height of the aerial.

The return currents from the aerial run along the wires of the screen, and except for the small amount which leaks through the screen the earth return currents are entirely avoided.

Those potential losses which occur at the earth's surface are also shielded by the screen, and if this is suitably designed, these losses can be reduced to a very small fraction of their original value.

The extensive use of screened aerials has shown that in actual practice they are of much higher radiation efficiency than the same aerials earthed.

The system has this merit—that it can be combined with the Alexanderson system so as to have the advantages of both. A series of screened aerials can be placed in parallel with the same advantage that ensues in the case of earthed aerials, and the method of paralleling them will be the same. Since each of the aerials has less resistance when screened than when earthed, the combined system will have less resistance than the combined earth system.

With this “feeder and earth screen” system a very long aerial can be used with advantage as regards capacity, and perhaps the most economical arrangement, certainly for all round purposes, is to bend the long aerial into the form of a circle and join the ends, thus reducing by one the number of masts necessary.

The proposed aerials for South Africa and Australia are designed on these lines.

SUMMARY.

It is pointed out that it is necessary to have enormous aerials for long distance radiotelegraphy, and that this necessity is forced on us by the limitation of aerial voltage which cannot be forced above 120,000 volts. If this limiting voltage could be raised there would be a commensurate decrease in the size of the aerial required.

Attention to the insulation problem may in the future solve the chief difficulty in aerial design, but the solving of this problem will only introduce the problem of resistance reduction in an acuter form.

If the size of any aerial is reduced the concentration of current and electric force must be increased, and since the losses are proportional to the square of these the resistance will inevitably rise. Again a reduction in the aerial capacity will necessitate an increase in the loading coil, the resistance of which may be a considerable portion of the total resistance of the aerial.

The improvement of the voltage limit and the improvement of the resistance must therefore go hand in hand if we are to get the full benefit of the former.

As a matter of finance it is the capital cost of the aerial compared with the running costs of power, etc., which has to be considered.

A raising of the voltage limit will probably decrease the former and raise the latter unless very great care is taken in reducing total resistance to the lowest possible figure. This last object may be achieved by no hide-bound adherence to any particular system, but by a careful analysis of all the losses so that they may be located and removed.

VALVE DESIGN AND MANUFACTURE

BY G. CHRISTOPHER MARRIS, B.Sc., M.I.E.E.

(OF THE

RESEARCH LABORATORIES OF THE GENERAL ELECTRIC CO., LTD.)

THE thermionic valve is a very perfect relay, rectifier, amplifier and alternating current generator of audio and higher frequencies. There is, therefore, a demand for types covering a very wide range of size and application, so that the limits to the possibilities of the valve are mainly those inherent in design and construction; and the user who understands these limits will best appreciate the behaviour and anticipate the faults in his valves.

THE VACUUM.

Considering first a most obvious point, it is clear that both manufacture and design are dominated by the necessity for a vacuum of a very perfect order. The pressure must be reduced to something like 0.00001 millimetres of mercury. The attainment of this result, indeed the evolution of the valve itself, is the fruit of many years' work, by physicists in many countries, on the various phenomena occurring in gases at low pressure. The methods of evacuation thus slowly perfected have proved very successful when adapted to the needs of manufacture.

In practice, each pumping unit is equipped with a rotary "oil box pump" giving a vacuum down to a pressure of about 0.001 millimetres of mercury, and a mercury vapour pump. The latter will exhaust to a very low pressure, the degree of vacuum being limited by the commencement of gas evolution from the walls of the pump; the lowest figure is perhaps 0.0000001 millimetres of mercury. The "oil pump" consists of a cylinder with blades, rotating in oil, which push the gas before them. It only begins to exhaust when a vacuum of about one centimetre is applied on its high pressure side, usually by means of a reciprocating piston pump. The mercury pump consists of a bath of mercury, heated by a gas ring, and boiling at a low temperature in the vacuum given by the "oil" pump. The vapour from the mercury rises as a blast and passes the opening connected to the vessel to be evacuated. The molecules of gas from the latter are hit by the mercury molecules and driven on towards the outlet leading to the "oil" pump. The mercury vapour itself is condensed by a cold water circulation and falls back into the pool of mercury in globules.

Such a pumping system operates with surprisingly little trouble, wear of the "oil" pump being perhaps the chief difficulty. A trap cooled with liquid air is necessary to prevent the mercury from getting back into the evacuated vessel and a gauge to measure the pressure is also necessary. The latter is usually a "McLeod" gauge, which consists of a bulb about two inches in diameter connected to the vessel to be evacuated; a capillary tube, closed at one end, is sealed on to the top of this bulb, while the bottom is connected to a mercury reservoir. By admitting air into the reservoir the mercury is driven up, compressing the gas in the bulb into the capillary tube. The height to which the mercury rises in the capillary tube is a measure of the vacuum.

It might be thought that with such pumps every molecule of gas would be eliminated from the system. But most valve users will be familiar with the fact that metal and glass contain gas "occluded" or absorbed in their substances. As already mentioned, this absorbed gas sets a limit to the vacuum, as it begins to be liberated from the walls of the vessel when the pressure has been reduced to about 0.0000001 millimetres of mercury; there are then in the "vacuum" some 3,000,000,000 molecules per cubic centimetre. Although this number sounds very large, it is enormously less than the number at atmospheric pressure 2.7×10^{19} per cubic centimetre.

The molecules are so minute that at a pressure of about 0.0001 millimetres of mercury one of them will travel a distance of say 100 centimetres, rebounding off the walls of a vessel before meeting another, and electrons will get across from filament to anode with little chance of collision. Amounts of gas of this order permit an electron discharge practically free from gas ionisation and can be ignored, but the gas which remains in the glass and metal of the valve cannot be neglected.

To a gas molecule the solid walls of the bulb, or the anode, or the grid wires, present a sponge-like front and at atmospheric pressure comparatively enormous quantities of gas are absorbed. Thus molybdenum will absorb several hundred times its volume of gas. The gas so absorbed can be loosened only by heating the parts in a vacuum, or by bombardment with electrons, which is equivalent to intense local heating. Design must, therefore, be directed to keeping the valve cool in use.

On the other hand, considerations of size or output may necessitate the generation of considerable heat, so that a compromise must be made, materials must be chosen which do not absorb gas readily, such as nickel and the nickel chromium alloy known as "nichrome." As little metal as possible must be used which again means compromise, for the internal parts must be mechanically strong. Nickel has the disadvantage that when the occluded gas is driven out by the heat it becomes very soft indeed. Molybdenum and tungsten on the other hand tend to become brittle.

Glass is a troublesome source of gas; on being heated in vacuum it gives up large quantities of water vapour and carbon dioxide; after a time, if the temperature is not too high, the evolution of gas stops and the surface is then comparatively gas free. If, however, the heating is continued nearly to the softening temperature of the glass, an almost ceaseless evolution of water vapour takes place; the evolution is more marked if at the same time the glass is subjected to electron bombardment.

The designer has, therefore, to be sure that no part of the valve will be over heated in operation; it is not sufficient that the average temperature should be right; there must be no single spot anywhere on the inside surface of the bulb at a temperature approaching the softening point of the particular glass used. This is the reason for the use of other materials such as silica or high melting point glasses when it is required to produce high powered valves. But such materials introduce other difficulties of their own, they may be expensive and require special ovens and gas flames in manufacture.

From the point of view of manufacture, the phenomena of absorbed gas mean that all the parts of a valve must be heated in vacua, and the general principle followed is that they should be taken to a higher temperature in manufacture than they will reach when the valve is in use.

The metal parts are given a preliminary treatment in a silica tube connected to vacuum pumps and heated by gas or electrically to about 1000°C. The parts are then assembled, mounted in the bulb, and the valve is connected to the pumps. An oven is lowered over the valve and the temperature raised as near the softening point of the glass as possible. After, say, half an hour of such baking the oven is raised, the anode is connected to a high tension supply, the grid is connected to the anode or to some lower voltage supply, the filament is lighted and an electron discharge takes place. The bombardment of the anode and grid by the electrons at once releases gas which is split up, ionised by the electron discharge, and a blue glow appears. During this period while the pump is exhausting the gas so released, the positive ions of the gas bombard the filament and would soon disintegrate it were the bombardment not stopped or reduced by the operator who switches off or dulls down the filament temporarily. As the bombardment proceeds the evolution of gas becomes less rapid, the blue glow disappears, and the anode becomes red hot. The gauge, however,

shows that gas is still present and the bombardment must be continued for a shorter or longer period according to the design of valve, until there is no cumulative evolution of gas at the maximum temperature for which the valve is designed.

This bombardment is a fairly close approximation to the conditions of actual use, and ensures that any parts subject to the bombardment of stray electrons which do not go direct from filament to anode are sufficiently free from gas.

There are a number of methods of adding substances which, by their action, plaster the gas on the walls of the bulb and keep it there. The most familiar is phosphorous, which is largely used in some methods of incandescent electric lamp production.

THE FILAMENT.

A hot filament familiar as a source of light is used in a valve to give a unidirectional stream of electrons and as such may be said to be the characteristic feature of a thermionic valve. It presents many problems in design and manufacture which will now be considered.

It might be assumed for simplicity that all solid bodies, if they could be made hot enough, would give off electrons. In practice most give off vapour and boil away before they become hot enough to emit electricity. But the more refractory metals, such as platinum, tungsten, thorium, and oxides, such as those of calcium, strontium and barium, will give a large and useful emission at temperatures which they can sustain. Filaments consisting of platinum covered with the oxides mentioned above have been the subject of extensive development in America, but the majority of valves in use at the present time have tungsten filaments run at temperatures from 2,300 to 2,550 degrees. At these temperatures the tungsten is evaporating and disintegrating as well as emitting electrons, and again a compromise becomes necessary, for as we increase the temperature of the filament its emission increases rapidly and the filament watts per ampere emission decreases. On the other hand, as we increase the temperature the life decreases very rapidly; for a given temperature the life increases as we increase the filament diameter.

An example will be instructive. Consider the case of two tungsten filaments, one 0.1 millimetres, one 0.3 millimetres diameter and the effect of running them at different temperatures. Approximate figures for such filaments can be tabulated thus:—

	0.1 mm. Diam.		0.3 mm. Diam.	
Heating current amperes	1.6	1.7	8.2	8.8
Temperature	2,400	2,500	2,400	2,500
Expectation of life in hrs.	1,500	300	2,000	600
Volt drop per cm. length	1.58	1.78	0.93	1.04
Emission current milliamperes ..	20	52	60	155
Heating watts per cm. length ..	2.53	3.02	7.62	9.15
Milliamperes of emission per watt heating current for one centimetre length (approximately) ..	8	17	8	17

The figures given are illustrative only. They are dependent to some extent on the composition of the wire used. In the case of life the published data, though increasing, are not exhaustive and from the nature of the case liable to error. It will be seen from the table that an increase of some six per cent. in filament current increases the temperature a hundred degrees, more than doubles the emission per watt of heating current, but decreases the life to about one-third. Further, that the thicker filament

has considerably longer life than the thinner at the same temperature. This is because failure usually commences with a local thinning, the resistance of the thin place rises, it gets hotter and evaporates faster. With a thicker filament there is not so rapid a temperature rise at the hot spot. The figures given assume that throughout life the temperature is constant, or what is nearly the same, the *volts* are constant. If the *current* is kept constant, as evaporation occurs and the wire thins, the temperature rises and the life will be reduced to a third or less of the figure obtained with constant volts.

Temperature is not the only factor determining the emission from a metal. It depends also on the atomic nature of the surface, being closely connected with the contact potential. Both the latter and thermionic emission depend on the amount of work that has to be done by an electron for it to get through the surface network of atoms. The metal thorium is far better from this point of view than tungsten but volatilises very easily. Recently, however, filaments have been developed making use of the emission of a thorium layer on a tungsten filament run at a comparatively low temperature. The result has long been familiar to valve makers as an accident, but has been brought to a stage where manufacture is possible as a result of close investigation.

ELECTRODE DIMENSIONS.

The electrode dimensions are settled in the first place by the power with which the valve has to deal; clearly there is an enormous range to cover, starting from the wireless receiving valve, which deals with inputs of microwatts, and outputs of the order of a milliwatt or less. Next comes the valve of a loud speaker telephone or local oscillator, giving perhaps a few milliwatts, and after that the series of transmitting valves from 20 watt output valves to the largest, capable of handling some 10 kilowatts in the case of glass or more for metal or silica valves. With increasing power comes increasing size, resulting from the need, first, of more emission from the filament, secondly, the necessity of dealing with greater heat radiation from the anode. Each step in size brings up again the same problems—how to increase the mechanical strength of glass and metal without complications from absorbed gas, how to increase the cooling surfaces, how to get in still more filament, and, since the anode voltage generally increases with size, how to improve the insulation.

The relative sizes of anode diameter, grid diameter and grid mesh necessary for a particular purpose can be calculated with a fair degree of accuracy. For an understanding of the calculation it is simplest to consider a valve used as an alternating current amplifier (*i.e.*, a high frequency or audio frequency amplifier). For such purposes the valve may be treated theoretically as an alternating current generator with an internal resistance R and a voltage MV , where V is the alternating current voltage applied to the grid, and M a factor depending on the dimensions of grid and anode. The factor M is commonly called the amplification factor of the valve and is greater the smaller the diameter and the closer the meshes of the grid. The amplifying power of the valve clearly depends on the M . The importance of the internal resistance R , though very great, is not so obvious. In the first place it determines the magnitude of the external impedance in the anode circuit, which for maximum efficiency should equal R . It has a direct bearing on the shape of the resonance curve of the tuned circuits connected to the valve. It also settles the voltage required to drag any particular value of electron current across the space so that for a given current a valve of high internal resistance requires high anode volts. In this connection it must be remembered as far as receiving valves are concerned that a very small current, say one quarter of a milliampere or less, is enough to give a loud sound in headgear telephones; on the other hand, a loud speaker usually requires several milliamperes.

The internal resistance increases as M is increased. For a given M it decreases as the filament length is increased and as the diameter of the grid is decreased with corresponding opening of the mesh. The internal resistance as here discussed is, of course, the alternating current resistance, which is the slope of the anode volts—anode current characteristic curve.

GENERAL.

It must be remembered that in a three electrode valve there are three circuits, the filament grid circuit, the filament anode circuit and the filament circuit itself. Different types of use bring into prominence various essential features in these circuits. Thus, consider the filament circuit of a valve for use in a shore wireless station or large steamer; here electric power to charge batteries is easily obtained and it matters little if each receiving valve filament requires ten watts or half a watt. In an aeroplane, or a mobile military station, small filament wattage is vital, it is important also to many amateurs. Still more do these factors influence the design of transmitting valves. An aeroplane may be fitted with a valve run so hot that its life is a few hours only, while at a large shore station the design may be such as to give a life of thousands of hours.

An important point about the grid circuit is the magnitude of the grid filament impedance. The ideal valve (apart from its use with grid current rectification) would have no grid current. A reasonably good amplifying valve must have very little and the vacuum must, therefore, be high and the grid wires fine. In a transmitting valve on the other hand considerable grid current is inevitable, in part due to the imperfection of the vacuum when operating hot, in part to the fact that the grid is a fairly large and stout mechanical structure which stops electrons, in part due to the capacity between grid and filament. Such a valve must be designed so that the platinum seal of the grid is large enough not to get overheated, and since it will be used at high anode voltages and in all probability ranges of grid voltage approximating to those of the anode, great care must be taken that insulation between grid, filament and anode shall be good, even though the glass of the bulb be covered with a slight metallic deposit of evaporated nickel and tungsten. The grid current when operating may be comparable to the anode current in amount.

The design of the anode circuit of a valve is clearly influenced very largely by the voltage applied to it. Since there is a limit to the size of filament and its emission, we must, in order to get more power, increase the anode volts. As the voltages become higher more and more care must be taken with arrangements for insulation, and it may be necessary to insulate the anode, not only from the filament and grid, but also from the metallic deposit on the glass. The principles that apply here are much the same as those for designing an insulator for use in rain, since the sputtered metal is usually carried in straight lines, like rain. What is perhaps not so obvious but well known to all valve users, is that the output of a valve bears a close relation to the watts radiated (and conducted) from the anode in the form of heat. The exact relation depends on the design of the circuits but may be anything from twice the dissipation figure for a conservative use, to ten times or more for special purposes. Watts radiated depend on anode surface and on temperature. Hence the use for large output valves of metals such as molybdenum, which can be run at a high temperature without melting or volatilisation. It has to be remembered that all the heat radiated by the anode must pass through the bulb. Silica has an advantage here since it transmits radiant heat more readily than glass, while metal envelope valves can be cooled by dipping in oil and water. The development of the latter is rendered difficult by the necessity of insulating the electrodes. Some insulators, usually glass of considerable size, must be sealed into the metal envelope. This is a more difficult operation than the converse one of sealing a platinum or tungsten wire into glass.

Those who see a large transmitting valve for the first time are probably astonished at the intricacy of the glass work, and the difficulties of making it must be obvious. A more subtle trouble, however, rises from the electrolysis of the glass. Cold glass is a good insulator; on heating it up the resistance falls rapidly and the figure at a given temperature varies enormously with the composition of the glass. Thus at 300° C. one glass may have ten times the specific resistance of another variety. The effect of this is serious, as a current may pass between the leading in wires, say, between the two legs of the filament, or between anode and grid and filament if too close together. As soon as a current begins it heats the glass locally and the effect is cumulative, resulting in deposition of lead from the glass followed by the appearance of cracks. The remedy is to use a glass chosen for its high insulation and avoid dangerous temperatures.

The leading-in wires present problems of their own, especially when required to carry large currents. Joints between metal wires and glass tend to be unsatisfactory as the diameter of the wire is increased, requiring special design and precaution in manufacture. The current passing through the seal must be kept within limits where it will not heat up the wires in the glass and so open the way for electrolysis.

The design of rectifiers follows closely that of the three electrode valves. It is usually simpler since the grid is omitted. At very high voltages, 30,000 or 40,000 new difficulties begin to appear, due to stray electron bombardment, so that special precautions must be taken to reduce this.

MULTIPLE AERIAL ARRANGEMENTS

BY DR. ENG A. MEISSNER.

From a practical point of view it is necessary that a modern transmitting system must often be able to work simultaneously with a large number of transmitters, and accordingly with several aerials which are partly suspended from the same masts. In this case mutual reactions of the aerials occur; they are produced by a magnetic coupling of the aerials in case of short waves, and by a capacitive coupling in case of long waves. The voltages which are produced by these two kinds of couplings are different in phase by 180° . In both cases the aerials can be completely centre-coupled by special centre-coupling arrangements, and therefore it is possible to work with equal, or nearly equal, wavelengths, even if the aerials are very close together and consequently very strongly coupled. If the wavelengths of the aerials are different, and if both aerials have to be completely centre-coupled, a special centre-coupling arrangement is necessary for each wave.

BECAUSE of the high demands which are put to our high-power wireless transmitting stations, it is often necessary that several transmitters and several aerials which are electrically separated from one another should work simultaneously. All the transmitters are appropriately placed into one single building. On the one hand the same masts, or at least some of them, must sometimes be used for several transmitting aerials, and on the other hand, in case of bad atmospheric conditions, several aerials have to be connected to one large aerial. A great difficulty is encountered, as only a small waverange is at the disposal of the high-power wireless stations, and consequently two transmitters, and correspondingly two aerials close together, have to emit waves of nearly equal length. The two above-mentioned wavelengths are only so slightly different from one another that they can only just be distinguished by an experienced receiving operator.

Fig. 1. Ground Plan of Aerial System.

The conditions of course, cause a very strong mutual reaction of the aerials, and it is therefore a question of the greatest importance for a radio-telegraphic plant to determine what kind of mutual reaction this is, and to find means of avoiding or compensating this reaction. This problem had to be solved on a large scale for the central transmitting station, Nauen, now being erected.

Fig. 1 shows the ground plan, and Fig. 2 a model of the new arrangement.

All the aerials are concentrated into the smallest possible area, and special care has been taken that the masts, especially the two centre masts of 250 m. in height, are made use of in the best way possible. (The external masts are 210 m. high.) The arrangement contains four large aerials separated from one another, which are marked A_1 , A_2 , B, C. Besides these, several smaller aerials which are not drawn in this figure, will be suspended from the centre masts later on. All these aerials are L-aerials. It is possible to use the aerials separately or to connect them in parallel at will. For instance, all four large aerials can be connected together.

Fig. 2. Model of Aerial System.

The electric dimensions of the plant are the following:—

Aerial.	Capacity.
B and C... ..	each 13,000 cm.
B + C	26,000 cm.
A_1 and A_2	each 35,000 cm.
$A_1 + A_2$	80,000 cm.
$A_1 + A_2 + B + C$	100,000 cm.

When the wavelengths of the two A-aerials, which are farther apart, are different from one another, the mutual reaction is slight; but a great difficulty arises with regard to both aerials and wavelengths being close together, as, for instance, A and B or C. In order to get a clear view in this case, a set of measurements was made with an aerial model in the scale of 1 : 20.

Curve 1 of Fig. 3 shows the current flowing in the C-aerial when the aerial A emits waves of 600 m. (600 m. correspond to the wavelength of 12 km. of the large Nauen aerial), and the aerial C is gradually tuned to the wavelengths 500 m.—800 m. (corresponding to the wavelengths 10 km.—16 km). The current is here measured in percentages of the current in the aerial A_1 . Curve 2 shows the reverse, that is, the current in the aerial A_1 , when the aerial C transmits. We see that even when the wavelengths of the aerials differ from one another by a few per cent., a considerable current, respectively the larger one, passes through that aerial through which it should not flow, that is, we reach a point at which it is impossible to work with both aerials at the same time. Through the two aerials being so close together, and the current passing through the wrong aerial, the radiating effect is only little diminished, but the tuning of the aerials to particular waves causes the greatest difficulty, as every tuning of the one aerial simultaneously reacts upon the sympathy of the other.

Fig. 3.

Curve K of Fig. 4 shows how strong and of what kind this mutual reaction is. The two model aerials A_1 and C were tuned to the same wave, and one of them was brought into oscillation by a buzzer. The partial waves were then measured, and the coupling between the two aerials calculated therefrom. The coupling-curve appears a little remarkable at first. The coupling, which is V when the wavelength is 420 m., increases whether the wavelength increases or decreases. As the two aerials are here coupled magnetically by means of the connecting-wires, as well as capacitively by means of the lines of force, directly passing over from one aerial to the other, this remarkable coupling-curve can only be explained by the opposing effects of these two couplings. These opposing effects are different when the wavelength is altered. At point M the magnetic coupling is just compensated by the capacitive coupling. We must assume that for shorter waves the coupling is magnetic, according to the schematic diagram of Fig. 5. The two aerials correspond to two current-loops A and B, which act upon one another by induction. The direction of this induction can be determined by the hand-rule. If there is an electromotive force E_A operating in the circuit A, an electromotive force E_{BA} acts on B; the direction of this force is shown by the arrow. The magnetic coupling is here principally done by the self-inductance of the connection wires. When the aerial wavelength is increased the self inductance, especially the mutual induction of the connection wires L_{12} , may be disregarded more and more in comparison

Fig. 4.

Fig. 5.

with the ever increasing self inductance of the inserted lengthening coils L_1 and L_2 , that is, the magnetic coupling $\frac{L_{12}}{\sqrt{L_1 \times L_2}}$ and its influence becomes less and less. With longer waves, on the right of point M in Fig. 4, the effect of the capacitive coupling dominates.

It is easy to show theoretically* that the magnetic and capacitive

Fig. 6.

coupling are exactly opposed to each other, that is, exactly 180° different in phase. If, according to Kirchhoff's laws, the sum of the currents and that of the voltages at a branching point in Fig. 6 is set down at V, we get:

$$F'_1 = F_1 + F'_2 - F_2$$

$$\frac{F_2}{C_2} + \frac{F'_1}{C_1} + \frac{F_3}{C_3} = 0.$$

respectively:

$$i\omega L_1 F_2 + r_2 F_2 + \frac{1}{i\omega C_2} F'_2 = 0 \quad (1)$$

* Compare: Korshenewski Jahrbuch Bd 19, S. 94.
Korshenewski u.M.Wien Jahrbuch Bd.

If we set down :

$$\frac{1}{C_1} + \frac{1}{C_2} + \frac{1}{C_3} = \frac{1}{C}$$

and

$$\frac{1}{C_2} \left(1 - \frac{C}{C_2} \right) = P_2$$

and

$$\frac{C}{C_1 C_2} = -P$$

we obtain, by eliminating F_2 from (I), the equation of the capacitively coupled system :

$$(I) \quad iwL_2 F_2 + F_2 r_2 + \frac{P_2}{iw} F_2 = -P \frac{F_1}{iw} = + \frac{i P F_1}{w}$$

The analogous equation of the magnetically coupled system is :

$$(II) \quad iwL_2 F_2 + F_2 r_2 + \frac{1}{iwC_2} F_2 = -iwM F_1$$

The expression C_2 in the equation (II) consequently corresponds to the expression $\frac{1}{P_2}$ in the equation (I), that is, for the capacity of the oscillating circuit (II) the value $\frac{C_2}{1 - \frac{C}{C_2}}$ has to be used instead of the value C_2 ; for the capacity is enlarged by the two condensers C_2 and C_3 connected in series.

The electromotive force acting upon the second circuit is, in case of magnetic coupling, equal to $i w M F_1$, and in case of capacitive coupling, equal to $\frac{P}{iw} L_1$. As the factors i and $\frac{1}{i}$ denote a phase-displacement of 180° , the electromotive force is exactly 180° different in phase in both cases.

This can also be seen in Fig. 7. The voltage across the condenser C_2 , operating over C_3 in circuit II, has the same direction as the voltage across the condenser C_1 in circuit I, and is consequently opposed to that voltage which is transferred by magnetic induction (Fig. 5).

Fig. 7.

The size of the capacity by which the two aerials are coupled can be determined by the coupling values which are found in circuit I by means of a buzzer. In case of mere magnetic coupling the coupling-coefficient is given by

$$\frac{M}{\sqrt{L_1 L_2}} = \frac{wM}{\sqrt{wL_1 \times wL_2}} ,$$

that is, by the ratio of the common inductance of the two circuits ($w M$) to the square root of the product of the inductances of the two single circuits. In order to obtain a similar expression of the coupling-coefficient in case of mere capacitive coupling, the inductances must be replaced by the corresponding capacitive reactances, that is, $w M$ by $\frac{P}{w}$ according to the

equation I and $w L_1$ and $w L_2$ by $\frac{P_1}{w}$ and $\frac{P_2}{w}$ respectively.

It follows that

$$K_2 = \frac{P^2}{P_1 \times P_2}$$

When the values for P_1 and P_2 and the equation $\frac{1}{C} = \frac{1}{C_1} + \frac{1}{C_2} + \frac{1}{C_3}$ are again used, it follows that :

$$K_2 = \frac{1}{\left(1 + \frac{C_1}{C_3}\right) \left(1 + \frac{C_2}{C_3}\right)}$$

According to curve K in Fig. 4 the coupling of the aerials is 6.5 per cent when the wavelength is 1,200 m. Using the measured static values of the capacities of the model aerials, $C_A = 1,620$ cm., and $C_C = 530$ cm., the equation—

$$K_2 = 0.06 = \frac{1}{\left(1 + \frac{1,620}{C_3}\right) \left(1 + \frac{530}{C_3}\right)}$$

gives the coupling capacity of the aerials

$$C_3 = 61 \text{ cm.}$$

Using this capacity value and the corresponding high frequency resistance we can also easily estimate how much current will pass from one aerial to the other at any wavelength, and in this way we obtain nearly the same values as those which were experimentally found according to Fig. 3.

For an exact calculation it should be taken into account that the currents are not quasistationary, that is, that the capacities of the aerials alter together with the wavelength.

The mutual reaction of the aerials, as shown in Fig. 4, must be eliminated by coupling them, that is, the E.M.F. which is produced by the existing capacitive or magnetic coupling must be compensated by an additional E.M.F. This E.M.F. must have a different value for each wavelength, as, according to Fig. 4, the coupling alters with the wavelength. A simple method for producing this E.M.F. is to let the lengthening coils of the two aerials, respectively part of them, act upon each other appropriately and in the right sense. This aim is reached by the above method, both for inductive aerial coupling as well as for capacitive coupling, because the mutual induction is altered by 180° by reversing one of the coils. The size of the required coupling self-inductance can simply be determined for every wavelength by tuning both aerials to the same wavelength and uncoupling them in the indicated way, and then measuring the mutual induction of the two coils. The curve L_{12} in Fig. 4 is found in this way, and shows that for a certain wave (point M) no counter-induction is required; this is the wavelength for which the coupling curve shows its minimum. The uncoupling self-inductance is negative on the left of point M, and positive on the right; that is, the corresponding necessary centre coupling voltages are 180° different in phase.

Instead of the magnetic inductive centre coupling a galvanic centre coupling can be used in connecting both aerials to a common coil, according to Fig. 8 for the left side of M, and according to Fig. 9 for the right side.

The arrangements of Figs. 8 and 9 concern the case that both aerials are tuned to the same wavelength. If the wavelengths of the aerials are different, for instance, $\lambda_A = 400$ m. and $\lambda_C = 600$ m., Fig. 4 shows that the coupling of the aerials would be 1 per cent. at a wavelength of 400 m., and 5 per cent. at 600 m., that is, properly speaking, it would be necessary to use different centre couplings for each wavelength, provided that both aerials are tuned to the same wave. In our case, $\lambda_C = 600$ m., and $\lambda_A = 400$ m., it must be considered that the high frequency resistance of the second aerial will be rather great for the passing of the wave of the first aerial, as the aerials are detuned by almost 50 per cent. Accordingly only little current

Fig. 8.

Fig. 9.

passes from A to C. As Fig. 3 shows, scarcely 2 per cent. of the current flowing in A are transferred to C, and if the wavelength of the transmitter C is 400 m., scarcely any current can be found in A. When the wavelengths are very different no centre coupling of the aerials is necessary, but when the difference is small, the currents in both aerials greatly increase, as Fig. 4 shows, and then the centre coupling must be made for each wave separately.

Fig. 10.

Fig. 10 shows a technical solution of this problem. The wave λ_1 is uncoupled by a simple magnetic centre coupling arrangement, and the wave λ_2 by a circuit which is tuned to λ_2 and connected to the aerials, as shown in the drawing. This circuit, through which the wave λ_1 cannot pass, prevents the centre coupling of λ_1 being altered in any way; but, on the other hand, this circuit makes it possible to adjust the phase as well as the amplitude of λ_2 in such a way as is necessary for centre coupling this wave. Instead of this intermediate circuit, a coil L_1 (dotted line in Fig. 10) can be connected (according to Alexanderson) to both aerials in order to centre couple the second wave.

As a rule it is sufficient in practice to centre couple one aerial, when the difference of the wavelengths is 6—20 per cent.; but when the difference is greater no centre coupling arrangement is necessary.

VALVE PATENTS FOR 1922.

By I. SHOENBERG.

No. 145,421. By SIEMENS & HALSKE AKTIENGESellschaft.

If we consider the complete anode circuit of the triode amplifier and denote the potential drop across the triode and output circuit by v_1 and v_2 , we must have at any moment :

$$v_1 + v_2 = E$$

where E is the voltage of the H.T. Battery. On the potential of the grid becoming more positive the current increases. As the resistance of the output circuit is constant, v_2 also increases. Since E is constant, it follows that v_1 must decrease. In other words, the anode potential decreases with increase of grid potential and *vice versa*. It is easily realised that these variations of the anode potential will affect the degree of amplification unfavourably. Indeed, the decrease of the plate potential has a retarding effect on the electrons emitted from the filament, which means a decrease in current. It is clear that the full increase of current which ought to have followed upon the increase of the grid potential is not obtained in view of the drop in the plate potential. In the same way a decrease in the grid potential is not fully utilised either, owing to the increase of the plate potential. In order to improve the efficiency of the amplifying triode, it is proposed to place an additional grid between anode and grid and to connect it to a point in the H.T. battery which will maintain it at a positive potential. The value of the latter is to be chosen in correspondence with the position of the additional grid in the electrostatic field between anode and cathode. The effect of such a "protective net" is explained as follows :

"The peculiar action of the protective net is explained by the fact that it protects electrostatically the field in the vicinity of the auxiliary electrode against the field of the anode, while at the same time the field directed from the protective net to the auxiliary electrode and partly extending into the space between cathode and auxiliary electrode causes the electrons to pass through the auxiliary electrode even in the case where, as is recommendable also for other reasons, the auxiliary electrode is given a potential that is lower than that of the cathode. In other words, the action of the protective net with regard to the field of the cathode is approximately the same as that of the anode, it protects, however, this field against fluctuations due to the fluctuations of the anode potential in correspondence with the anode current."

"In order to provide against a substantial part of the current being short-circuited into the protective net, the potential of the protective net, in such tubes, which are mainly operated with electron currents is kept lower than the potential of the anode. Where space-charging effects need not be feared, the potential is kept even lower than that which would be obtained with the anode voltage used, but without employing a protective net, at the point of fixation of this latter, that is to say at the point where this net is disposed."

No. 147,147. By THE BRITISH THOMSON-HOUSTON Co., LTD. (Assigned By E. F. W. Alexanderson.)

Fig. 1.

The specification describes a method of arranging several triodes in cascade in such a manner that the ratio between the strengths of the desired signal and an interfering one can be considerably increased.

One embodiment of the invention is shown in Fig. 1. Suppose the coupling between antenna 1 and closed circuit 3 and the sharpness with which the latter can be tuned are such that two signals

of the same amplitude but differing by a certain amount in frequency impressed from the antenna on the closed circuit produce there oscillations with relative amplitudes 1 and .1. Assume further that triode I is so adjusted that both signals are reproduced in the anode circuit the degree of amplification being such that the strength of the desired signal induced in circuit 15 is again 1. If the selectivity is the same as for circuit 8 the undesired signal will possess only a strength .01 in circuit 15. By connecting circuit 15 across grid-filament of the triode II it will be clear for the same reasons as above the strength of the interfering signal will be reduced to .001 in circuit 19. It follows that interference will be greatly reduced in relation to the desired signal by using a sufficient number of sharply tuned circuits coupled to each other through triodes.

Fig. 2.

A further example is illustrated on Fig. 2. Here the principle is the same, only the tuned circuits (e.g. 55-60) are so arranged that each of them forms the anode circuit for one triode and at the same time the grid circuit for the next one.

No. 147,148. By THE BRITISH THOMSON-HOUSTON Co., LTD. (Assigned by I. Langmuir).

The specification describes the method, which has now become classical, of employing the triode with a condenser shunted by a high resistance placed in the grid lead for detection. The explanation of the operation of the circuit by the inventor is exactly the same as the one given in most modern text-books. It will therefore suffice here to quote the first 3 claims, which read as follows:—

- "(1). A wireless signalling system including an electron discharge device having connected to its grid or control electrode a condenser which has a leakage path connected across its terminals, for the purpose specified."
- "(2). A wireless signalling system including an electron discharge device having an electron emitting cathode, a co-operating anode and a grid for controlling the electron discharge, a condenser connected in circuit with the grid and a high resistance to shunt the condenser."
- "(3). A receiver for wireless signals provided with a grid leak comprising a high resistance preferably in series with a source of electromotive force, connecting the plates of a condenser included in the grid circuit of a three-electrode electron discharge device."

No. 147,441. By GESELLSCHAFT FUR DRAHTLOSE TELEGRAPHIE m.b.H.

The subject matter of the invention is clearly stated in the claims, which read as follows:—

- "(1). An electronic tube or triode of which the cathode is formed of an alkaline earth metal."
- "(2). An electronic tube or triode of which the cathode is formed of calcium."
- "(3). An electronic tube or triode of which the cathode is formed of magnesium."

No. 147,616. By THE BRITISH THOMSON-HOUSTON Co., LTD. (Assigned by I. Langmuir.)

The invention relates to the construction of grids for triodes. An inspection of the drawings (Figs. 3, 4, 5 and 6), and an examination of the first six claims quoted below will sufficiently explain the subject-matter of the patent.

"(1). An electron discharge device comprising an evacuated envelope containing an anode, a cathode and a conductor serving as a discharge controlling electrode wound about a rigid framework spaced about the cathode."

"(2). An electron discharge device as claimed in Claim 1, in which the discharge controlling electrode consists of a wire wound to and fro on the framework with closely adjacent turns to form a grid located between the cathode and anode."

Fig. 3.

Fig. 4.

"(3). An electron discharge device comprising an evacuated envelope containing a supporting framework which carries a filamentary cathode adapted to be operated at incandescence and also carries a discharge controlling grid surrounding the cathode and is located between the cathode and a co-operating anode."

"(4). An electron discharge device as claimed in Claim 1, in which the discharge controlling electrode is wound over rods of insulating material spaced apart and lies closely adjacent to the cathode."

Fig. 5.

Fig. 6.

"(5). An electron discharge device as claimed in Claim 1, in which the frame bearing the discharge controlling electrode is formed of conductive material."

"(6). An electron discharge device as claimed in any of the previous claims in which both the discharge controlling electrode and the anode are formed of tungsten wire."

No. 148,314.. By E. F. HUTH, G.m.b.H.

The invention relates mainly to the method of evacuating thermionic tubes. The essence of the invention is made clear in the first two claims which read as follows:—

"(1). Process for the manufacture and operation of electron discharge tubes having filament cathodes characterised by the feature that other vapour, alcohol vapour, or benzol vapour, or the vapour of other easily volatile hydrocarbons is admitted to the tube in small quantities and again exhausted, in order to augment the thermionic current and increase the efficiency of the tubes."

"(2) A process as claimed in Claim 1, characterised by the feature that the pumping of the tubes takes place in the presence of *i.e.*, with the gradual exhaustion of the admitted gases or vapours, and with a simultaneous flow of current, so that the metal parts are thereby brought to incandescence."

No. 147,814. BY THE BRITISH THOMSON CO., LTD. (Assigned by I. Langmuir.)

In this specification a method is given of utilising the triode for the purposes of, what one may call, the transformation of D.C. In Fig. 7

1 and 2 are the negative and positive mains respectively of the D.C. supply, the voltage of which it is desired to change. 9 is a transformer for impressing an A.C. potential between grid 5 and filament 6. Suppose that at a certain moment the potential of the grid resulting from the combination of the potentials due to the battery 11 and the A.C. supply is positive; current will flow through circuit 4-6-1-2-3. After a short interval, however, before

Fig. 7.

the current is built up to its maximum value it will be stopped owing to a change in the sign of the grid potential caused by the A.C. source. Consider now what will happen to the energy "stored up in the medium surrounding coil 3," which is of considerable inductance. This energy will be returned and discharged through the unilateral discharge device 14.

"The energy thus given to the second circuit cannot return to the first, as current can flow in only one direction, through the electron discharge tube 14. It will be seen that by this means a succession of impulses of current is delivered to the second circuit. The frequency of these impulses will depend upon the frequency of the source 9, but they will all be in the same direction. By giving these impulses a high enough frequency and by inserting a condenser 18 between the conductors 12 and 13 a unidirectional and continuous current of constant voltage is secured in the second circuit. The voltage of the current delivered in the second circuit will depend upon the resistance of that circuit. It will also be apparent that by connecting several transforming devices in parallel and exciting their grids by alternating current sources differing slightly in phase relation, a practically continuous succession of current impulses may be delivered in the second circuit. In order to decrease the time required for the current in the coil 3 to build up to the desired value a condenser 19 may be connected across the supply mains 1 and 2."

No. 147,823. By THE BRITISH THOMSON-HOUSTON CO. LTD. (Assigned by I. Langmuir.)

The specification describes a method of heterodyning, somewhat differing from the one usually employed. The main characteristic feature consists in the fact that the locally produced H.F. oscillations are applied between

Fig. 8.

plate and filament of a triode, while the signals to be received are impressed between the grid and filament of the triode. Of course, the frequency of the local source is adjusted to differ from that of the signal, in order to obtain an audible note. One embodiment of the invention is shown on Fig. 8. It will be seen that with this arrangement the current flowing through the triode will depend upon the phase difference existing at the moment between the potentials of the plate and grid. Suppose that at a certain moment plate 8 is made positive by the H.F. potential impressed on it from the local source 12 through transformer 13-11. Assume also that at this

moment grid 5 is also caused to be positive by the signal received on the aerial 1. In the result, current will flow through the triode 3. Owing, however, to the difference between the frequencies of 12 and of the signal, after a short interval, both plate and grid will be negative. At that moment, the passage of any current between plate 8 and filament 6 become impossible.

We have taken two extreme conditions and left out all the intermediate stages. It is obvious, however, that the phase difference between the plate and grid potential will be continually changing owing to the difference between their frequencies. The current through the triode will vary correspondingly with the result that a note with a pitch depending on the frequencies of 12 and of the signal will be heard in telephone 9. It should be realised that owing to the above outlined inter-action, rectification will be taking place at the same time. On the whole, the working of the arrangement is very similar to that of the well-known Goldschmidt "tone-wheel."

No. 147,851. By GESELLSCHAFT FUR DRAHTLOSE TELEGRAPHIE m.b.H.

It is well known that the anode current, grid voltage characteristic of a triode is nearly rectilinear only along a certain portion. In the lower part especially, it possesses a "knee" which is followed on by a flat portion almost coinciding with the X-axis. Owing to this, when such a triode is used for generation, or amplification, in certain cases, the oscillations have

Fig. 9.

Fig. 10.

Fig. 11.

a shape similar to the one shown on Fig. 9, that is to say, the resulting wave is not of a pure sine form but possesses many harmonics. In order to overcome this difficulty, it is suggested that the triodes should be connected in opposition, as shown in Fig. 10. The characteristic of such a combined device will be rectilinear as will be seen from Fig. 11, provided of course the characteristics of both triodes are identical. The oscillations obtained from such an arrangement will be of a pure sine form.

No. 147,853. By GESELLSCHAFT FUR DRAHTLOSE TELEGRAPHIE m.b.H.

When triodes are employed in cascade one may use for intercoupling purposes, tuned circuits. Great efficiency will be obtained in this manner, but on the other hand the system will be highly selective and whenever it is desired to receive a new wavelength a retuning of all intermediate circuits will be required. Under many circumstances this is undesirable and the present invention proposes to overcome this difficulty by employing for the inter-coupling of the several triodes the so-called "chain-conductors" or filters.

Fig. 12.

Fig. 13.

In Fig. 12, the chain-conductor for connecting the triodes 1 and 2 is made up of inductance coils 3 and 4 and condensers 5, 6, and 7. The behaviour of such a composite conductor for various frequencies is amenable to calculation, but it will suffice here to consider only the qualitative side of the question. It is obvious with the arrangement shown on Fig. 12,

the condensers 5, 6, and 7 will present a very high impedance to long wave oscillations. As the frequency increases the impedance of the condensers decreases. The inductances behave in the opposite manner. We would expect therefore a large potential difference at the terminals of 7 for long waves. On the other hand for short waves the potential difference will be small owing to the almost short-circuiting effect of the capacities. In other words with such an interconnecting link between the triodes we should expect a larger magnification on long waves than on short ones. As a matter of fact calculations show that if we draw a graph with the frequencies as

Fig. 14.

Fig. 15.

abscissae and degrees of amplification as ordinates we shall obtain a curve of the shape shown on Fig. 13. If the places of the inductances and capacities are interchanged as in Fig. 14, the curve shown in Fig. 15 is obtained. If a combination of both methods indicated in Figs. 14 and 15 is employed as in Fig. 16, a curve similar to the one shown in Fig. 17 is obtained. It will be seen that only frequencies lying within a certain narrow band are amplified efficiently. All other frequencies either lower than (b) or higher than (a) will not get through the filter.

Fig. 16.

Fig. 17.

No. 148,130. By BRITISH THOMSON-HOUSTON Co., LTD. (Assigned by I. Langmuir.)

The specification describes a method of forming the anode of a diode or triode by depositing on the walls of the glass container a thin gas-free metallic film.

As shown in Fig 18, the device contains originally two filaments. 2 and 3 one is intended to serve as a cathode. The other filament is evaporated by passing a comparatively strong current. The stem 6 is so shaped as to prevent the formation of a continuous film in contact with the filament. The process of manufacture is described as follows:—

"The container is first exhausted to a good vacuum as may be obtained by means of a pump by chemical exhaust or other means, the envelope being heated during pumping to remove water vapour. The preliminary exhaust should reduce the pressure to one micron (0.001 millimetres) or less; the completion of the vacuum may be carried out by the active vaporisation of a tungsten conductor in a side chamber by heating it electrically to about 2,700 to 2,900 degrees Centigrade, preferably in the presence of a small amount of anhydrous pentoxide of phosphorous. The envelope is then sealed off, as indicated at 9, and one of the refractory conductors, for example, the filament 3, is heated to about

2,700 degrees to 2,900 degrees Centigrade, by passage of current, thereby depositing the desired gas-free film as indicated at 10. Contact is made with

Fig. 18.

the film 10 of vaporised metal by sealed-in wires 11, two being provided to ensure a good contact. This film is gas-free and even when no more than 10^{-6} millimetres in thickness can only with the greatest difficulty be scratched off the glass with a knife."

The current carrying capacity of such films is stated to be about 100 milliamperes and more.

No. **148,131**. By BRITISH THOMSON-HOUSTON CO., LTD. (Assigned by W. C. White.)

The invention relates to a triode generator in which, however, the principle of retroaction is not involved.

It is well known that by properly choosing the values of the anode and grid potentials the grid-current, grid voltage characteristic can be made to have the shape shown on Fig. 19. The main feature of the curve consists in the "falling" portion BC. If the valve is adjusted to a point on this portion, oscillations are generated in a circuit containing inductance and capacity in series for the same reasons as in a Duddell, arc.

Fig. 19.

Fig. 20.

One method of utilising a triode working under the above conditions for heterodyne reception is shown in Fig. 20. Here the circuit 5-6-2-4 is tuned to a frequency slightly differing from that of the signals received on antenna 10. The beats thus obtained are rectified and amplified in the anode circuit. The iron-core choke 8 is introduced in order to prevent the circuit of the grid battery 7 from having a short circuiting effect on the oscillatory circuit 5-6. The air-core choke 9 prevents H.F. oscillations from flowing the battery circuit. It is well known that iron-core chokes like 8 are not sufficient for that purpose in view of their self-capacity.

No. **148,447**. By GESELLSCHAFT FÜR DRAHTLOSE TELEGRAPHIE m.b.H.

It is known that a valve generator working on the principle of reaction sometimes starts oscillating at an undesirable frequency. The reason for this becomes clear if we consider Fig. 21. It will be noticed that the coupling

Fig. 21.

Fig. 22.

between the plate and grid circuits is effected by means of the inductance coils 3 and 4. The connections are made in such a manner as to obtain a phase difference of 180° between the grid and plate voltages. This, as is well known, is a necessary condition for the action of the triode as a generator. Let us now take into account the capacities between anode and filament on the one hand and between grid and filament on the other. These capacities are denoted by 10 and 11 on the drawing. If we redraw for clearness

Fig. 21, we obtain Fig. 22. Any circuit like 12 or 13 inserted between the terminals of an A.C. source may be equivalent to either a capacity or an inductance according to the frequency. Indeed the impedance of a condenser decreases and that of an inductance increases with the increase of frequency. It follows that, generally speaking, the current in the condenser branch will grow while the current in the inductance branch will fall as the frequency increases. Further as the current possesses with respect to the applied E.M.F. a lag of 90° in the inductance and an advance of 90° in the condenser the resulting current is determined by the difference. Therefore, if the frequency is so high that the condenser current is larger than that flowing in the inductance coil, the resulting current will be in advance of the E.M.F. and the whole circuit will behave as a capacity and *vice versa* for lower frequencies the whole circuit will behave as an inductance. It is clear now that the circuit 13-12-7'-9 has two degrees of freedom:—

(1). When circuits 12 and 13 are both equivalent to capacities the condenser has to be considered as connected in series with condensers equivalent to circuits 12 and 13. The resulting capacity will be small and the natural wavelength short.

(2). When circuits 12 and 13 are equivalent to inductances the natural wavelength will obviously be long.

There is of course the possibility of circuit 12 say, being equivalent to a capacity and circuit 13, to an inductance. We need not, however, consider the case, for the plate and grid potentials will then possess a phase difference other than 180° and the valve will not oscillate.

Fig. 23.

Fig. 24.

We see now why the valve may start oscillating at a frequency different from the one desired. In order to overcome this difficulty it is proposed in the specification to introduce impedances in such a manner as to make the conditions for the undesirable frequency unfavourable. Fig. 23 shows one method of attaining this end. It will be seen that a condenser 14 has been introduced in parallel to coil 4. Referring back to Fig. 22, we find that this means increasing considerably the capacity of condenser 11 in circuit 13. In the light of the explanations given above we see that for the short wavelength the potential across 4 will be small since condenser 14 serves as a short-circuit for this frequency. Owing to this the retroaction from the anode to the grid circuit will be reduced and its valve may be made insufficient for the starting of oscillations on the short wave.

Another method is shown in Fig. 24. Here a rejector circuit 16 tuned to the undesirable wave is introduced between grid and filament. As this circuit is equivalent to a very large impedance for the frequency to which it is tuned it will be seen that a considerable portion of the potential difference across 4 due to the retroaction will be spent between the terminals of circuit 16. The potential difference between the grid and filament will be small and the effect is again the same as if the coupling between the plate and grid circuit has been reduced to a value which is insufficient for the triode to oscillate on the undesirable wave. On the other hand, in so far as the other wave is concerned the introduction of the rejector circuit will have no effect since its impedance for that frequency is small.

No. 148,992. By GESELLSCHAFT FÜR DRAHTLOSE TELEGRAPHIE m.b.H.

The invention relates to the use of triode amplifiers and rectifiers in connection with recorders of the type in which a direct current relay is employed. As shown in Fig. 25 the oscillations received on antenna 1 are

rectified by means of a crystal. The resulting low frequency oscillations are then amplified by triodes 4 and 5 and impressed between grid and filament of triode 9. The grid of the latter is adjusted by means of

Fig. 25.

amperes are mentioned in the specification.)

potentiometer 11 to a negative potential of such a value that no current will pass through the tube and the windings of the relay 12 connected in the anode circuit. On the arrival of signals, however, the grid will become less negative during the positive half-cycles and the electromagnets of the relay will become energised. Triode 9 it will be realised, acts both as a rectifier and amplifier and its dimensions are comparatively large as it has to deal with large currents. (Values of 5-10 milli-

No. 149,214. By S. Loewe.

This relates to an arrangement for modulating in sympathy with the voice the H.F. currents radiated from an aerial. As will be seen from Fig. 26 the speech currents are impressed through microphone transformer 15 between grid and filament of controlling triode 10. The anode filament path of the latter is connected in parallel to anode filament of generating triode 1. When the microphone is spoken into the conductivity of 10 varies in accordance with the variation of its grid potential thus varying at the same time the amplitude of the H.F. oscillations radiated by the antenna. As the control triode 10 requires smaller anode potentials than the generating triode 1, a counter electro-motive-force 16 has to be used if both triodes are connected to a common high tension source 5.

Fig. 26.

No. 149,240. By E. F. HUTH, G.m.b.H.

The invention relates to a peculiar arrangement for receiving with a triode. According to the specification the incoming signal is impressed not between grid and filament as usual, but between the anode and filament. An example is shown on Fig. 27, where it will be seen that anode coil 3 is arranged to constitute a part of the receiving aerial 1. The circuit 13-15 is tuned approximately to the same frequency as the aerial and is connected through a resistance 14 to the grid on the one hand and to the filament on the other.

Fig. 27.

It is claimed that with this arrangement, where the incoming oscillations are applied across plate filament, rectification and amplification are obtained. Moreover, for reception of continuous waves it is sufficient to slightly mistune the system; the local oscillations will then combine with the received ones to form beats of audible frequency. It is very hard to account for the working of the arrangement unless one assumes that owing to the coupling between grid and plate circuits (which is unavoidable), the incoming oscillations are after all impressed between grid and filament.

No. 155,789. By L. A. HAZELTINE.

It is well known that in triode generators the alternating current components and anode-potential are out of phase by 180°. This follows first of all from the quite general consideration that the triode is employed for

supplying energy to the oscillatory circuit. Secondly, this is confirmed by the fact that with the increase of current the potential drop across the useful resistance inserted in the anode circuit also increases. As the potential of the high tension supply is constant the anode potential must decrease. It is clear, therefore, that the phase relations between anode-current and anode-potential can be expressed graphically in the manner shown in Fig. 28, where the full line and dotted curves represent the current and potential respectively. The energy consumed in the triode will be determined at any moment by the

Fig. 28.

Fig. 29.

product of the corresponding ordinates of the curves, and may be represented in relation to time by the shaded area shown on Fig. 29. If the current curve is to be kept sinoidal the minimum consumption in the triode will take place when the amplitude of the generated alternating current is made to reach such a value that the lower peaks of the curves touch the time axis. When this condition is fulfilled the input power is given by the product J_G and V_B which denote the values of the direct current and battery potential respectively. On the other hand the power consumed will be:

$$\frac{J_G}{\sqrt{2}} \times \frac{V_B}{\sqrt{2}} = \frac{J_G \times V_B}{2}$$

i.e. the maximum efficiency cannot be more than 50 per cent. if the current and potential are to obey the sine law.

Fig. 30.

The efficiency can be considerably improved if one departs from the sine law. Take for instance the curves shown on Fig. 30. Here, for the greater part of the cycle the state of things is such that when the current is maximum the anode potential is zero and *vice versa*. Owing to this, losses would occur in the triode only during a small fraction of the cycle. On the other hand, however, the curves not being sinoidal, possess

several harmonics. If the oscillations are used for radiation it is most important that these harmonics should not reach the aerial, for otherwise interference will be caused on several wavelengths.

According to the invention high efficiency and a pure radiated wave are obtained by combining two triodes in opposition. In order to get a clear idea of the working of such a circuit we shall refer to Figs. 31-35 explained by the inventor as follows:—

Fig. 31.

Fig. 32.

Fig. 33.

"In Fig. 32 the variations of anode current i_a , control potential e_g , and anode potential e_p , with time are shown, the control potential e_g varying sinusoidally and biased by a negative battery voltage E_c , the anode potential

e_p , also varying sinusoidally about its battery voltage E_b . The curve of the anode current i_p is derived from that of the control potential e_g by reference to the characteristic curve of Fig. 31."

"In Fig. 33 the deviation y of the anode current from a straight line is shown plotted against the control potential e_g . If the biasing voltage E_c is properly chosen this deviation curve will be substantially symmetrical about a vertical axis. In this case the anode current curve i_p , as shown in Fig. 32, will contain only even harmonics. Having thus substantially eliminated all odd harmonics, the even harmonics may be cancelled out by the use of two like valves connected in opposition to constitute a single oscillator."

"It will thus be seen that in accordance with this invention a symmetrical arrangement of circuits including two valves (or two groups of valves) may be connected so that the even harmonics generated by the valves cancel each other out, and that combined with this arrangement a single biasing control voltage can be provided that will substantially eliminate odd harmonics."

Fig. 34.

Fig. 35.

"In Fig. 34 such an arrangement as described above is shown in which 1 represents a master oscillator coupled by means of the transformer 2 to the control electrodes or grids 3 and 4 of the power oscillator valves 5 and 6, the secondary of transformer 2 being provided with a midtap leading to the filaments 7 and 8 of the valves 5 and 6 through the biasing battery E_c . The control potential e^1_g and e^{11}_g of the valves 5 and 6 then vary in opposite directions, or in other words are displaced 180° in phase. The anode current i^1_p and i^{11}_p of the valves 5 and 6 are therefore also displaced 180° in phase. These anode currents i^1_p and i^{11}_p flow in opposite directions through the two halves of the primary of transformer 9 and therefore their even harmonics will be in phase with one another and will be without effect on the secondary or antenna circuit 10, 11. The fundamental anode currents will not be cancelled out by this arrangement because they flow in the same direction through the halves of the primary of transformer 9."

"In Fig. 35 the two anode currents i^1_p and i^{11}_p , mentioned in connection with the operation of the circuit arrangement shown in Fig. 34, are shown, with their difference $(i^1_p - i^{11}_p)$; the latter which is sinusoidal, is the effective current acting on the secondary circuit 10, 11."

In the light of the explanations given above in connection with the basic idea underlying the invention there will be no difficulty in appreciating the following statement made in the specification:—

"It is desirable to point out that the anode current of an oscillator should be very small while the anode potential is large; for this will make the loss in the valve low and will improve the efficiency considerably. If it is attempted to reduce all harmonics merely by operating the oscillator over a substantially straight portion of its characteristic curve, the upper limit to the efficiency in the anode circuit is 50 per cent., which would be obtained if the anode current and anode potential just reached zero during each cycle and both were sinusoidal. If, however, even harmonics are permitted in the anode current and are later cancelled out by the use of this invention, then the upper limit to the efficiency is correspondingly 78.5 per cent."

The gain in efficiency is important not only *per se*, but also because comparatively small valves can be employed for large outputs. Suppose the

dimensions of a triode are such that it will stand without damage an internal loss of 2 kW. At an efficiency of 50 per cent. the output can be only 2 kW. At an efficiency of 78.5 per cent. the input will be determined from the equation :

$$X \times \frac{22.5}{100} = 2$$

$$\text{Whence } X = \frac{200}{22.5} \text{ kW.}$$

and the output will be :

$$\frac{200}{22.5} \times 2 = \frac{155}{22.5} = 7 \text{ kW, nearly.}$$

The output with the same triode has therefore been increased 3.5 times.

No. 157,407. By GESELLSCHAFT FÜR DRAHTLOSE TELEGRAPHIE m.b.H.

There are two well-known methods for connecting the modulating (or controlling) triode to the generator. The first case is illustrated on Fig. 36. Here the triode 11, the resistance of which is varied by the microphone through transformer 12, is connected, if one may put it so, in series with the generating triode 2 and high tension supply 1. It is obvious that modulation is effected with this arrangement by the variation of the voltage drop across E_a across the generator 2. Take the two extreme conditions :—

(1). The grid 11 is brought to such a negative value by the microphone transformer that no current can flow through 11. Its resistance is then infinite with the result that the voltage drop across 2 will be zero. Therefore, the amplitude of the generated oscillations will also be zero.

(2). The grid of 11 is made so positive that the resistance of this triode becomes very small in comparison with that of 2. E_a will then differ very little from E_m (the voltage of 1), and the amplitude of the generated oscillation will reach a maximum. It will be seen, therefore, that with this method of arranging the controlling valve the modulation may be complete. On the other hand, however, the intensity of modulation is weakened owing to the fact that E_m varies in such a manner as to oppose the effects of the variations in the resistance of 11. Indeed, when the resistance of 11 is small, the voltage across 1 (E_m) diminishes with the result that E_a also diminishes and the amplitude of the generated oscillation is smaller than one would expect ; and *vice versa* when the resistance of 11 increases, E_m also rises and E_a does not reach the minimum value.

Fig. 36.

Fig. 37.

The second method of connecting the controlling triode is shown on Fig. 37. Here the current is kept approximately constant by the iron choke-coil 20 placed in the anode lead from the source of supply. During the periods when the resistance of the controlling triode 15 is low the current flowing through it increases, therefore less current will pass through generator 2 and the amplitude of the oscillations will be small. Obviously, the current through 2 can never fall to zero, for this would be possible only if the resistance of 15 could be made zero. It will be seen that while complete modulation can be obtained with the first method (for it is easy to make the resistance of a triode infinite), the same result cannot be obtained with the second for the reduction of the resistance of the triode to values approaching zero is impossible. As to the effects of the variation in the resistance of the triode on E_m , they are evidently just the opposite of those explained above when dealing with the first method.

The invention forming the subject matter of the specification consists in the combining of both methods as shown on Fig. 38. Here triode 11 is in series with, while triode 15 is in parallel to, the generator 2. Both 11 and 15 are influenced by the microphone through a transformer 16 provided with two secondaries 18 and 19 wound in opposition. It follows that when the grid of 15 is made negative, the grid of 11 will be made positive. The resistance of 15 will increase and more current will flow through 2 and the amplitude of the generated oscillation will likewise increase. At the same time the resistance of 11 will decrease, the potential drop across 2 will increase leading again to more powerful oscillations. The two controlling valves thus co-operate in so far as modulation is concerned. On the other hand, if the circuit 20-15-11 attached to the source of supply is considered, it will be seen that its resistance remains practically constant, seeing that the variations in the resistances of 15 and 11 are of an opposite nature. On the whole, a system is obtained which permits of complete modulation, while the potential difference across the supply is not affected by the variations which are necessary for modulation.

Fig. 38.

No. 160,456. By M. LATOUR.

In cases where several triodes are used for receiving or other purposes it is sometimes convenient to connect all the filaments in series. If, however, one of the filaments is destroyed, all the triodes are put out of action

Fig. 39.

and where many are employed it may become rather troublesome to locate the faulty triode. According to the invention the difficulty is overcome by providing resistances 6, 7 and 8 (see Fig. 39), shunted across the filaments 4 and 5. In case of one of the filaments breaking down, current will still be passing and the remaining filaments will be brought to a dull red glow. The faulty triode can therefore be replaced at once.

No. 160,799. By R. LEVY.

The invention relates to a novel circuit for employing the triode as a high frequency generator. It is based on the so-called "multivibrator" invented by Prof. Abraham, and is shown on Fig. 40.

To understand the working of this circuit, imagine that for some reason the potential of the grid 4 has become slightly increased. More current will flow through triode 1, and the potential drop across the high resistance 9 will increase. As the voltage of battery 11 is given and constant, a greater potential difference across 9 means a smaller potential difference across the triode. The potential of the anode 5 is therefore decreased, and as 5 is connected through condenser 14 to grid 7 the potential of the latter will diminish, less current will flow through triode 2 and therefore its anode potential will increase. In view of the connection of 8 and 4 through condenser 13, the potential of 4 will be further increased. It appears therefore that the current will be continually growing in one triode and falling off in the other. This process, however, will go on only until the grid of one triode becomes so negative that the flow of current is stopped entirely. The potential of point 47 will then practically be the same as of battery 11 and therefore the potential of grid 4 will also remain constant. Of course the process will also stop when the current in triode 1 reaches its saturation value. It will be seen that this state of equilibrium cannot be stable. The charges on the grid will leak off through resistances 18 and 17 and a new process will start in the opposite direction. It follows that oscillations will be generated with a periodicity depending on the values of the resistances and capacities.

Fig. 40.

From the explanations given above it will be seen that there is nothing which would make us expect that the oscillations would obey the sine law. As a matter of fact the oscillations thus produced prove to possess very many harmonics (sometimes about 150) and this makes the circuit very convenient for calibrating wavemeters. On the other hand, however, the abundance of harmonics renders the "multivibrator" inapplicable to wireless purposes.

According to the invention, Prof. Abraham's circuit is modified by introducing between points x , y or x^1 , y^1 one of the circuits shown on Figs. 41, 42 and 43. The inventor explains the effect of the modification as follows:—

Fig. 41.

Fig. 42.

Fig. 43.

"The invention comprises another improvement which is important. It has been observed experimentally that in the arrangement carried out above, the resistance 10 may be dispensed with when a suitable quantity of resistance represented by 21 and 22 is introduced into the oscillating circuits."

"In this form the invention consists finally in replacing one of the resistances of the multivibrator by an oscillating circuit. The tension in the oscillating circuit regulated to resonance for the fundamental period of the multivibrator being in phase with the tension in the resistance 10, as regards this fundamental frequency the conditions of the phenomenon of oscillation are not changed. The same is not true of the harmonics, and in particular with the circuits shown in Figs. 42 and 43, the amplitude thereof diminishes considerably. Thus the new combination realised has, as a result, a great improvement of the efficiency of transformation of continuous energy into alternating energy of the fundamental frequency and a diminution of the harmonics."

Various applications of the modified "multivibrator" circuits, especially to wireless telephony and directional signalling, are illustrated in the specification.

171,717	20/5/20	13,968/20	J. Scott-Taggart and Radio Communication Co., Ltd.	Reception of C.W.
171,782	23/8/20	24,451/20	A. Young	H.F. Alternators
172,127	2/9/20	25,390/20	A. K. Macrorie, H. Morris- Airey and G. Shearing	Elimination of harmonics from valve generators
172,350	6/7/20	19,063/20	J. Scott-Taggart and Radio Communication Co., Ltd.	Valves in series for reception or transmission
172,376	31/8/20	25,065/20	J. Scott-Taggart and Radio Communication Co., Ltd.	Valves as current limiting devices
172,389	2/9/20	25,370/20	J. Scott-Taggart and Radio Communication Co., Ltd.	Modulation with valves
172,394	3/9/20	25,408/20	J. Scott-Taggart and Radio Communication Co., Ltd.	Method of eliminating interference
172,593	24/8/20	24,547/20	B. T. H. Co., Ltd. ..	Magnetically controlled valves
172,717	10/9/20	26,036/20	R. E. H. Carpenter, F. G. Creed and Creed & Co., Ltd.	Relay (mechanical) for weak currents
172,757	24/9/20	27,189/20	J. Scott-Taggart and Radio Communication Co., Ltd.	Relays in combination with valves
172,758	24/9/20	27,190/20	J. Scott-Taggart and Radio Communication Co., Ltd.	Valve generators
173,284	16/9/20	26,538/20	Western Elec. Co., Ltd. ..	Transmission of call sign for wired wireless
173,320	29/9/20	27,629/20	British Insulated and Helsby Cables, Ltd., and E. A. Bayles	Condenser
173,363	16/10/20	29,304/20	F. Trippe and General Elec. Co., Ltd.	Seals for valves
173,514	28/12/20	34,843/20	H. Abraham	Interrupters: suppression of sparking
173,568	3/9/20	25,426/20	J. Scott-Taggart and G. G. Farley	Means for supporting electrodes of valves
173,621	8/10/20	28,599/20	F. G. Creed and Creed & Co., Ltd.	Relays (mechanical)
173,793	11/5/17	19,376/20	M. Latour	Valve amplifier
173,832	13/9/20	26,241/20	S. Brydon and S. Johnson	Valve generators
174,064	17/7/16	500/22	A. V. T. Day	Method of eliminating interference
174,093	20/10/20	16,712/19	J. M. Furnival	Microphone

BRITISH PATENT SPECIFICATIONS PUBLISHED DURING 1922 (continued).

Specification No.	Date of Application.	No. of Application.	Name of Inventor.	Subject.
174,134	30/9/20	27,709/20	J. Scott-Taggart and Radio Communication Co., Ltd.	Valve generators
174,149	13/10/20	28,972/20	B. T. H. Co., Ltd.	Valve in which filament is situated between grid and plate
174,298	12/3/21	7,889/21	A. R. Taylor	Means of mounting valves on bases
174,312	25/1/19	421/22	A. V. T. Day	Method of eliminating interference
174,429	22/10/20	29,929/20	H. Abraham and M. Philippson	Radiogoniometers
174,672	21/9/20	26,923/20	International Radio Telegraph Co. and J. L. Hogan	Reception of C.W.
174,975	13/9/20	26,244/20	R. C. Galletti	Tuning of wireless circuits
174,980	4/10/20	28,101/20	A. G. T. Cusins and H. Whittaker-Swinton	Mounting of vacuum tubes
175,052	8/11/20	31,529/20	B. T. H. Co., Ltd. and R. C. Clinker	Frequency meters
175,315	16/8/20	23,861/20	B. T. H. Co., Ltd.	Aerials
175,402	15/11/20	32,225/20	A. K. Macrorie, G. Shearing and H. Morris-Airey	Method of eliminating harmonics from valve generators
175,403	15/11/20	32,226/20	A. K. Macrorie and W. A. Appleton	Reception of C.W.
175,459	2/12/20	34,129/20	F. Reynolds and Silica Syndicate, Ltd.	Supporting electrodes of valves
175,679	12/10/20	28,906/20	C. S. Agate and W. Wilans	Recorders
175,720	15/11/20	32,238/20	S. G. Frost	Aircraft generators
176,127	30/11/20	33,849/20	J. Erskine-Murray and J. Robinson	Direction finding
176,128	30/11/20	33,853/20	H. S. Mills	Design of C.W. transmitters
176,390	5/11/20	33,606/20	W. H. Eccles	Valves in series for detecting and amplifying
176,401	3/9/20	25,451/20	Siemens & Halske, A.-G.	Relays in combination with valves
176,491	6/12/20	34,469/20	L. G. Preston, C. L. Fortescue, H. Morris-Airey and G. Shearing	Multiphase supply for valves
176,892	15/12/20	35,336/20	H. J. Round	Aerials
176,893	15/12/20	35,337/20	C. S. Franklin	Aerials
176,898	16/12/20	35,464/20	L. G. Preston, B. Hodgson and T. E. Goldup	Supporting electrodes of valves
176,932	5/1/21	461/21	N. W. McLachlan	Relays for weak currents : recorders
177,193	19/10/20	29,515/20	P. P. Eckersley and H. J. Round	Method of connecting aerials to valve generating circuits
177,240	20/12/20	35,755/20	W. J. Davis	Calling device
177,267	24/12/20	36,233/20	Marconi's W.T. Co., Ltd. and N. E. Davis	C.W. transmitters
177,269	24/12/20	36,251/20	L. G. Preston, G. Shearing and H. Morris-Airey	Multiphase supply for valves
177,270	24/12/20	36,252/20	L. G. Preston, B. Hodgson and S. R. Mullard	Supporting filament of a valve
177,345	12/2/21	4,995/21	Gen. Elec. Co., Ltd. and A. C. Bartlett	Holders for valves
177,816	30/9/20	27,772/20	J. H. Whittaker-Swinton	Multiphase supply for valves
177,869	4/1/21	297/21	T. L. Eckersley	Aerials
177,912	26/1/21	3,175/21	G. P. Grenfell and J. Robinson	Aerials
177,938	15/2/21	5,248/21	J. S. E. Townsend and J. H. Morrell	Wavemeters
178,397	11/4/21	16,494/21	R. E. J. Varret	Condenser
178,616	9/2/21	4,617/21	B. T. H. Co., Ltd.	Filaments for valves and lamps
178,872	29/10/20	30,576/20	J. Scott-Taggart and Radio Communication Co., Ltd.	Modulation with valves
178,906	19/1/21	2,560/21	B. T. H. Co., Ltd.	Magnetically controlled valves
178,917	21/1/21	2,841/21	T. H. Nakken	Transforming light impulses into electric current impulses
178,957	29/1/21	3,527/21	N. Lea and Radio Communication Co., Ltd.	Call device
178,971	4/2/21	4,228/21	Mitchell's Elec. & Wireless, Ltd. and R. Heather	Modulation with valves
178,992	15/2/21	5,232/21	B. T. H. Co., Ltd. and E. F. W. Alexanderson	Multiplex transmission : aerial system
179,016	25/2/21	6,370/21	Western Elec. Co., Ltd.	Secret system of wireless telephony
179,307	3/2/21	4,091/21	Gen. Elec. Co., Ltd. and F. Trippe	Construction of transmitting valves

BRITISH PATENT SPECIFICATIONS PUBLISHED DURING 1922 (continued).

Specifi- cation No.	Date of Applica- tion.	No. of Applica- tion.	Name of Inventor.	Subject.
179,321	5/2/21	4,300/21	P. P. Eckersley, J. M. Furnival, H. R. C. Van de Velde and J. Stewart	Source of supply of current for valves
179,347	19/2/21	5,743/21	B. T. H. Co., Ltd. and R. C. Clinker	Portable receivers
179,568	5/11/20	31,376/21	J. Scott-Taggart	"Negatron"
179,670	12/2/21	5,015/21	L. G. Preston, H. Morris-Airey and G. Shearing	Elimination of harmonics in valve generators
180,069	21/2/21	5,807/21	J. Scott-Taggart and Radio Communication Co., Ltd.	Duplex
180,090	28/2/21	6,641/21	Western Elec. Co., Ltd.	Cathodes for valves
180,349	18/11/20	32,569/20	F. E. Pernot	Separation of different frequencies
180,400	15/2/21	5,231/21	B. T. H. Co., Ltd., & E. F. W. Alexanderson	Method of running H.F. Machines in parallel
180,405	16/2/21	5,392/21	Société des Etablissements Gaumont	Magnetically controlled valve with several anodes
180,542	5/5/21	12,906/21	L. H. T. Holden	Rotary spark-gaps
180,745	28/2/21	6,596/21	W. H. Wilson	Production of H.T. discharges
181,047	19/1/21	2,576/21	O. C. Roos	Arc generators
181,095	3/3/21	7,029/21	G. M. Wright	Multiplex transmission and reception
181,208	30/4/21	12,460/21	N.W. MacLachlan	Means for obtaining high voltage impulses
181,400	4/12/20	34,316/20	J. Scott-Taggart	Method of receiving C.W.
181,483	14/3/21	8,021/21	Deutsche Telefonwerke, G.m.b.H.	Wired wireless
181,489	15/3/21	8,140/21	Deutsche Telefonwerke, G.m.b.H.	Wired wireless
181,514	24/3/21	9,133/21	Deutsche Telefonwerke, G.m.b.H.	H.F. cable telegraphy
181,799	16/3/21	8,277/21	H. J. Round	Reception of C.W.
181,812	17/3/21	8,412/21	Compagnie Générale d'Electricité	Supporting electrodes of valves
181,827	19/3/21	8,630/21	C. K. Chandler	Direction finding
181,909	27/4/21	12,148/21	M. Osnos & Gessellschaft für drahtlose Telegraphie m.b.H.	Frequency changers
182,155	31/1/21	3,709/21	T. D. Parkin	Calling or alarm devices
182,168	21/3/21	8,730/21	C. S. Agate & P. W. Willans	Valve generators
182,218	31/3/21	9,552/21	R. Whiddington	Duplex system of wireless telephony
182,516	7/3/21	7,333/21	H. St. J. de Aula Donisthorpe	Magnetically controlled valves
182,671	20/6/21	16,840/21	J. W. Greenwood	Relays for weak currents. Loud speakers
182,853	8/3/21	7,423/21	Deutsche Telefonwerke, G.m.b.H.	Wired wireless
183,203	12/4/21	10,690/21	Deutsche Telefonwerke, G.m.b.H.	Wired wireless
183,312	30/5/21	14,996/21	G. Krawinkel	H.F. alternators
183,879	7/2/21	4381/21	B. T. H. Co., Ltd.	Magnetically controlled valves
183,896	1/4/21	9,752/21	S. R. Mullaard & Mullaard Radio Valve Co., Ltd.	Cooling electrodes of valves
184,216	24/3/21	9,185/21	J. H. Whittaker-Swinton	Multiphase currents for valves
184,282	13/5/21	13,566/21	W. H. Eccles	Aerial system
184,498	8/2/21	4,513/21	B. T. H. Co., Ltd.	A.C. Supply for valves
184,506	11/2/21	4,904/21	B. T. H. Co., Ltd.	Magnetically controlled valves
184,560	11/5/21	13,426/21	B. T. H. Co., Ltd.	"Dynatron"
184,862	18/5/21	13,952/21	B. T. H. Co., Ltd.	"Dynatron"
184,875	20/5/21	14,143/21	B. T. H. Co., Ltd.	Reception of C.W.
184,903	25/5/21	14,561/21	B. T. H. Co., Ltd.	Arc generator in the form of a valve
184,904	25/5/21	14,573/21	C. S. Franklin & P. P. Eckersley	Duplex system
185,030	9/9/21	24,026/21	Western Elec. Co., Ltd.	Manufacture of electrodes of valves
185,133	17/2/21	5,456/21	J. Scott-Taggart & Radio Communication Co., Ltd.	Valves as current limiting devices
185,167	19/5/21	14,063/21	B. T. H. Co., Ltd.	"Dynatron"
185,169	20/5/21	14,158/21	A. Taylor	Direction finding
185,178	24/5/21	14,453/21	B. T. H. Co., Ltd.	Directional receiving system
185,180	25/5/21	14,518/21	G. H. Moody	Receiver design
185,252	17/6/21	16,718/21	B. T. H. Co., Ltd.	Cooling anode of valve

NOTE.—The above List of British Patents includes those published between 30th September, 1921, and 28th September, 1922.

U.S.A. PATENT SPECIFICATIONS PUBLISHED DURING 1922

Specifi- cation No.	Date of Applica- tion.	Patentee.	Assignee.	Subject.
1,396,030 1,396,571	25/7/17 13/9/18	W. Dubilier .. A. N. Goldsmith and J. Wein- berger	— G. E. Co. of America	Variable condenser Duplex Receiving system
1,396,897	8/10/17	P. Thomas ..	Westinghouse Electric and Mfg. Co.	Condenser
1,397,093	27/9/19	L. Espenschied ..	American Telephone and Telegraph Co.	Relay stations for increasing range
1,397,432	16/6/17	C. V. Logwood	—	Relays in combination with valves
1,397,575	9/4/15	L. de Forest ..	De Forest Radio Telephone and Telegraph Co.	Valve with five electrodes for amplifying
1,398,848	30/3/20	J. Erskine-Murray and J. Robinson	—	Direction finding
1,399,005 1,399,251	14/6/18 31/7/17	G. B. Crouse .. E. L. Chaffee ..	Sperry Gyroscope Co. —	Spark gaps Method of reducing atmos- pherics
1,399,254	30/6/17	J. H. Hammond, Jr.	—	System of radiodynamic control
1,399,945	24/7/20	H. F. Elliott ..	A. Taylor	Method of signalling with arc generators
1,400,235 1,400,517 1,400,591	14/9/16 26/4/19 12/3/19	J. H. Payne, Jr. A. E. Blondel .. C. D. Ehret ..	G. E. Co. of America — —	Valve generator Recording apparatus Quiescent system for wireless telephony
1,400,847	31/12/18	E. F. W. Alex- anderson	G. E. Co. of America	Control of speed of H.F. alternator
1,401,121 1,401,644	24/5/18 31/7/17	R. M. Allen .. C. W. Rice ..	Western Elec. Co. G. E. Co. of America	Mountings for vacuum tubes Valves in cascade
1,402,235 1,402,931 1,402,933 1,403,640	22/1/20 18/3/15 6/7/16 20/2/20	H. Jorgenson .. P. C. Hewitt .. P. C. Hewitt .. H. J. Round and G. M. Wright	— — — Radio Corporation of America	Spark transmitter design Valve generator Valve generator Direction finding
1,403,700 1,403,701 1,403,835	30/10/16 22/1/17 30/9/19	F. S. McCullough F. S. McCullough O. B. Blackwell	G. L. Martin .. G. L. Martin .. American Telephone and Telegraph Co.	Directive transmission system Relay Frequency control system
1,403,841	30/9/19	J. R. Carson ..	American Telephone and Telegraph Co.	Frequency control system
1,404,573	13/6/17	L. M. Brillouin and G. A. Beauvais	—	Valve for detecting
1,404,574 1,404,726	25/4/18 14/1/19	L. N. Brillouin .. E. F. W. Alex- anderson	G. E. Co. of America	Valves in cascade Method of removing sleet from antenna
1,405,523 1,405,905 1,406,149 1,406,328	28/12/17 4/2/21 22/1/18 29/1/17	M. C. A. Latour .. F. W. Dunmore .. T. W. Case .. A. L. Atherton	— — — Westinghouse Electric and Mfg. Co.	Valves in cascade Aerials Selenium cell Temperature regulating means for filament of valve
1,406,442	28/12/18	L. Cohen ..	—	Electrostatic-coupled receiver
1,406,445	19/6/19	C. A. Culver ..	—	Photographic receiving appa- ratus
1,406,857	26/10/16	R. A. Heising ..	Western Elec. Co.	Switching over from trans. to recep., and vice versa, for valve generators
1,406,996	30/9/20	J. B. Morrill ..	Western Elec. Co.	Position and distance determi- nation by wireless
1,407,103	17/2/17	F. K. Vreeland ..	—	Method of eliminating atmos- pherics
1,407,205	26/12/16	R. H. Marriott ..	—	Method of eliminating atmos- pherics
1,407,245	18/9/20	J. B. Bolitho ..	—	Relay

U.S.A. PATENT SPECIFICATIONS PUBLISHED DURING 1922 (continued).

Specifi- cation No.	Date of Applica- tion.	Patentee.	Assignee.	Subject.
1,408,053	8/8/19	R. J. Wensley ..	Westinghouse Electric and Mfg. Co.	Cathode for valve
1,408,738	23/7/19	G. Hill	L. Steinberger ..	Variable condenser
1,408,992	14/2/21	J. W. Doron ..	S. W. Doron ..	Variometer
1,409,352	20/2/18	S. E. Adair ..	Western Elec. Co.	Inductances
1,409,717	29/10/15	P. C. Hewitt ..	—	Valve generator
1,410,062	10/5/20	G. Holst and E. Oosterhuis	N. V. Phillips' Gloe- lampenfabrieken	Rectifier for A.C.
1,410,730	5/1/20	R. R. Beal ..	A. Taylor	Arc generator
1,410,793	9/11/20	A. Bonnefont ..	—	Crystal detector
1,410,890	8/8/18	J. R. Carson ..	American Telephone and Telegraph Co.	Method of, and means for, modulating carrier oscillations
1,411,814	30/4/18	H. M. Stoller ..	Western Elec. Co. ..	Aircraft installations
1,412,385	17/11/20	T. W. Case ..	—	Selenium cells
1,412,567	30/12/16	J. Mills ..	Western Elec. Co. ..	Method of eliminating atmos- pherics
1,412,853	30/9/19	L. Espenschied	American Telephone and Telegraph Co.	Synchronising system
1,412,908	10/6/20	K. S. Van Dyke	American Telephone and Telegraph Co.	Synchronising system
1,413,732	2/10/16	R. A. Heising ..	Western Elec. Co. ..	Source of supply of grid potential
1,414,232	12/8/19	A. H. Taylor and L. C. Young	—	Method of receiving C.W. with compound heterodyne
1,414,629	15/7/18	M. M. Dolmage ..	—	Duplex system
1,415,179	21/7/20	E. T. Jones ..	—	Switching device
1,415,220	18/6/21	H. F. Causebrook	—	Condenser
1,415,382	17/1/18	J. W. Milnor ..	Western Union Tele- graph Co.	Amplifier
1,415,845	10/2/16	M. I. Pupin and E. H. Armstrong	—	Selectively opposing impedance to received oscillations
1,415,992	22/3/18	L. M. Clement ..	Western Elec. Co. ..	Multiplex receiving system
1,415,999	1/11/16	A. M. Curtis ..	Western Elec. Co. ..	Method of eliminating atmos- pherics
1,416,061	18/12/17	M. J. Pupin and E. H. Armstrong	—	Selective receiving system
1,416,077	8/3/19	D. C. Tanner ..	Western Elec. Co. ..	Modulation with valves
1,416,774	17/4/20	C. Bardeloni ..	—	Method of using crystal de- tectors on combination with valves
1,417,662	16/6/17	L. de Forest ..	—	Valve with 5 electrodes
1,418,066	2/6/20	T. R. Bunting ..	—	Duplex system
1,418,285	10/10/18	J. R. Carson ..	American Telephone and Telegraph Co.	Carrier current telegraphy
1,418,518	20/9/20	E. F. Bell ..	—	Quenched rotary spark gap
1,418,729	25/4/19	A. S. Oswald ..	Western Elec. Co. ..	Aerial for aircraft
1,418,739	4/6/17	E. O. Scriven ..	Western Elec. Co. ..	Valve generator
1,419,528	25/10/18	H. W. Weinhart	Western Elec. Co. ..	Method of supporting electrodes of valves
1,419,530	12/8/18	W. Wilson ..	Western Elec. Co. ..	Method of increasing the emis- sion in valves
1,419,547	12/11/18	C. D. Ehret ..	—	Valves with 5 electrodes
1,419,562	29/9/19	R. V. L. Hartley	Western Elec. Co. ..	Modulation with valves
1,419,797	13/2/19	E. F. W. Alexand- erson	G.E. Co. of America	Valve amplifying system
1,420,055	13/12/20	H. W. Nichols ..	Western Elec. Co. ..	Selective receiving system
1,420,254	20/5/12	J. H. Hammond, Jr.	—	Antennæ
1,420,255	27/2/13	J. H. Hammond, Jr.	—	Antennæ
1,420,256	25/2/13	J. H. Hammond, Jr.	—	System of teledynamic control
1,420,257	21/1/10	J. H. Hammond, Jr.	—	Automatic wave selection
1,420,258	3/9/13	J. H. Hammond, Jr.	—	System for the radio-control of moving bodies
1,420,485	18/5/20	G. F. Johnson ..	—	Variable condenser
1,420,629	29/3/18	J. H. Hammond, Jr.	—	System of teledynamic control
1,422,013	6/2/20	L. B. Turner ..	—	Negative resistance : production of by 2 valves
1,422,312	12/2/19	F. S. Smith ..	Products Protection Corporation	Condenser

U.S.A. PATENT SPECIFICATIONS PUBLISHED DURING 1922 (continued).

Specification No.	Date of Application.	Patentee	Assignee	Subject.
1,422,837	13/10/17	I. B. Crandall ..	Western Elec. Co. ..	Connecting transmitters to valve amplifiers
1,422,882	1/9/15	H. W. Nichols ..	Western Elec. Co. ..	Modulation with valves
1,423,345	20/5/21	D. G. McCaa ..	C. D. Ehret ..	Method of receiving C.W.
1,424,065	27/6/21	E. H. Armstrong ..	—	Super-regeneration
1,424,091	21/1/19	C. R. Fountain ..	—	Valve generator
1,424,141	16/6/19	L. F. Fuller ..	A. Taylor ..	Arc-generator
1,424,294	11/5/22	S. G. Frost ..	—	Aircraft generator
1,424,365	5/4/20	E. H. Loftin and H. H. Lyon	—	Antennæ
1,424,805	16/6/17	L. de Forest ..	—	Subterranean signalling system
1,424,866	17/2/17	P. I. Wold ..	Western Elec. Co. ..	Means for relaying modulated carrier waves
1,425,154	13/12/17	R. A. Weagant ..	Radio Corporation of America	Method of eliminating atmospherics
1,425,522	7/6/17	J. H. Hammond, Jr.	—	Multiplex transmission system
1,425,523	22/6/17	J. H. Hammond, Jr.	—	Transmission system
1,425,912	17/8/20	R. T. Staples ..	Western Elec. Co. ..	Condenser
1,426,132	23/3/17	F. N. Waterman	Radio Corporation of America	Direct-reading wavemeter
1,426,133	12/12/17	R. A. Weagant ..	Radio Corporation of America	Method of eliminating atmospherics
1,426,137	16/4/21	G. M. Wright ..	Radio Corporation of America	Radiogoniometer
1,426,733	14/2/18	R. A. Heising ..	Western Elec. Co. ..	Means for preventing amplifiers from oscillating
1,426,734	30/4/19	W. F. Hendry ..	Western Elec. Co. ..	Supporting electrodes of valves
1,426,743	9/6/22	F. J. Kaehni and W. L. Kaehni	—	" Loud speaker."
1,426,754	23/10/16	R. C. Mathes ..	Western Elec. Co. ..	Circuits for electron discharge devices
1,426,755	9/5/19	H. S. Read and R. C. Mathes	Western Elec. Co. ..	Multi-stage amplifier circuits
1,426,801	21/3/17	W. Wilson ..	Western Elec. Co. ..	Repeater for undulatory currents
1,426,826	19/7/17	H. C. Egerton ..	Western Elec. Co. ..	Circuits for electron discharge devices
1,426,943	23/9/16	E. F. W. Alexander	G. E. Co. of America	High-frequency alternator
1,426,944	4/9/17	E. F. W. Alexander	G. E. Co. of America	Multiplex transmitter
1,427,350	2/9/19	J. Bethenod ..	—	Method of coupling antenna to H.F. alternator
1,427,832	7/7/19	F. S. McCullough	G. L. Martin ..	System of radiotelephony
1,427,833	2/8/19	F. S. McCullough	G. L. Martin ..	Direction finding
1,428,507	12/3/20	E. A. Sperry ..	—	Wireless control system
1,428,856	13/5/18	L. O. Parker ..	Westinghouse Elec. and Manufg. Co.	Spark-gap apparatus
1,429,227	28/9/21	W. Dubilier ..	Dubilier Condenser Co.	Variable condenser

NOTE.—This list includes those published between December 1st, 1921, and October 15th, 1922.

A. SIGNALLING ON OUR AIRWAYS.

BY DUNCAN SINCLAIR.*

ONE of the first considerations, if not *the* first, in any system of modern transport lies in the insurance of rapid, accurate and reliable communication facilities between the various stages of the route.

The enormous forward step from the old stage coach days, with their delightful lack of signalling arrangements and frequently of personal security, to the wonderful existing scheme of the up-to-date railway, with all its attendant speed, comfort and reliability, necessitated the origination and operation of signalling arrangements which are still a constant source of admiration to the man in the street and to those whose daily task it is to travel by rail.

The introduction of aircraft on a commercial transport basis, and for the conveyance of passengers and mails, was a step, the magnitude of which could justifiably be compared with the advent of the steam railway train in coaching times, and it at once became apparent that a new and entirely different system of signalling would be necessary in the new scheme of things. No longer could the signals be set against the train bringing it to a standstill in any desired sector of the line. No longer could the various parts of the route be kept clear and the guarantee of a clear line be advertised by the familiar green light or drooping signal arm. And an additional factor to be considered in the smooth running of the system crept in—the factor of weather. The question as to whether it is a fine, clear day or whether it is foggy and raining does not delay the driver of a railroad express in his departure, but weather conditions militate with, however, steadily decreasing ability, against the departure or passage of an air express. To all the ordinary signalling necessary for handling traffic must be added, therefore, a rapid method of disseminating meteorological information along an air route. Again, considerable distances are covered, so that communication with the aircraft themselves is quite essential as they pass along the routes. Radio telegraphy is the one system of communication which fulfils all these requirements most readily; and radio telegraphy and radio telephony, as a consequence, have been adopted and adapted on the Air routes. The place already occupied by wireless in the mercantile marine bids fair to be out-rivalled by that of the aerial traffic of the future. There are territorial limits to the operations of a railway company, and limits to the number of ports to which a steamship line can send their vessels, but upon the aerial train or liner these limits are imposed to a far less degree, and the applications of wireless are multiplied correspondingly.

THE ORGANISATION OF THE AIR ROUTE.

The modern air route is divided up into stages, at each stage being one of three classes of aerodrome:

- (a) Terminal aerodrome;
- (b) Intermediate aerodrome;
- (c) Emergency landing ground.

The two former are fully equipped aerodromes, are kept open in exactly the same manner as a railway station, and are equipped with wireless facilities; the latter maintains no wireless station. Emergency aerodromes are only used where it is necessary for an aircraft to land to effect repairs, which would prevent it from continuing its journey to a terminal or intermediate station, and which cannot be carried out in flight. They are the "sidings" of the airway.

* Of the Department of Communications, Air Ministry.

A sketch map of the existing terminal and intermediate aerodromes in the British Isles is shown in Fig. 1, all of which have their own wireless telegraphy and telephony stations. Details of these stations have already been published in a Paper read by the writer before the Radio Society of Great Britain, on January 27th, 1921, under the heading "The Wireless Stations of the British Commercial Airways"; and although improvements have been effected on the technical side, yet, in the main, these stations remain the same to-day.

THE TERMINAL AERODROME.

The Croydon Aerodrome, London's Air Port, is the one terminal aerodrome as yet actually in existence in the British Isles; but there can be little doubt that any air port which may later be developed will be modelled along the lines of Croydon.

The whole aerodrome is under the control of a single official, who is known as the Civil Aviation Traffic Officer (C.A.T.O.). The scope of his responsibilities is considerable, in that he must be capable of performing the combined duties of Traffic Manager, Superintendent of the Line, and of Customs Officer and Immigration Officer if necessity arises; and he is responsible for the control and safety of an aircraft during the time that it is in the air, and this responsibility only ceases when it has left his area, or has landed.

Directly under the C.A.T.O. come the various officers concerned with the different duties of the air port, Traffic Stores, Meteorological, Accounts, Navigation and Wireless, the latter named being responsible for the efficiency of the aerodrome Wireless Station and its staff, and advising, if necessary, upon points relating to wireless in the aircraft of the different companies. His is the controlling station of the whole air route system of wireless, and he therefore needs to exercise the greatest possible amount of care and tact in getting the best out of his subordinate stations and of the operators in the air. His is the task of maintaining a good liaison between those wireless men who fly daily, and those, whose duty is perhaps equally wearing and responsible, who keep a close watch on the aircraft and guide them in safety on their way.

Each aviation company has an office situated upon the aerodrome itself, apart from any other which it may have in the metropolis, and this office is supplied with a telephone connected to the aerodrome exchange. In this way the company's representative is able to speak direct to any point within the airport, or to any ordinary telephone subscriber outside. Three British companies are subsidised by the Government at the present time, and guarantee regular services to the Continent. Messrs. Handley-Page operate the London-Paris airway; Daimler Airways provide the service London-Amsterdam-Berlin, with an extension to Manchester, and an ultimate extension in prospect to Hamburg and Berlin, and Messrs. Instone's machines travel daily from London to Brussels, with an extension to Cologne, where their service will undoubtedly in due course link up with the German system. This means that unnecessary competition between the British firms is avoided, and each journey is carried out in the most economical manner possible.

A Trust House hotel is also situated at Croydon for the benefit of passengers delayed or wishing to break their journey; and a service of cars operated by the companies, conveys the passengers, their luggage and any merchandise or goods to and from the air port. A post office, bookstall, porters, interpreters and messengers are available, and in every way the terminal aerodrome forms the counterpart of the big continental railway terminus. The large hangars, wherein are housed the air liners and air taxis form an increasingly popular source of interest to a good many Londoners. It would seem that the older generation of schoolboy, whose leisure moments

were frequently spent sitting by the side of the railway noting carefully the numbers of the passing locomotives, is now almost replaced by a newer type whose greatest ambition is apparently to differentiate between the many classes of aircraft constantly arriving and departing. It is truly a sign of the times.

THE INTERMEDIATE AERODROME.

The best existing example of this type of air station is at Lympne, near Folkestone, where a facsimile of the organisation at Croydon is reproduced. As comparatively few through air expresses land at Lympne, the necessity for general accommodation on so large a scale does not arise, but there are Customs and Immigration Offices working under the C.A.T.O., and a route radio telephone station in direct communication with Croydon and St. Inglevert, near Calais. Such regular aircraft as those employed on the Ostend newspaper service, however, operate from Lympne, so that the station is a busy one. The work of the wireless station is, for the most part, that of communicating with the various aircraft in flight, informing their pilots of weather conditions along the route, passing them information concerning their passengers and freight, and frequently acting as a relay station from Croydon to them.

TRAFFIC CONTROL.

In order to reserve entirely the attention of the terminal and intermediate route wireless stations to aircraft in flight, every station and every aeroplane instrument, both transmitting and receiving, is adjusted to the "aircraft wave." In precisely the same manner that the 600 metre wavelength is reserved for shipping of the mercantile marine, so the wavelength of 900 metres is set aside for mercantile aircraft, and other stations are not allowed to radiate signals of any kind on that wave. Aircraft move very rapidly in comparison with other modes of transport and their communications must therefore be of a nature essentially rapid and brief. In the case of a ship a delay of a minute or two would cause no serious inconvenience in establishing communication and in passing a message. The aeroplane, during the same period of time, may have changed its position by perhaps two to three miles, a fact fraught with serious consequences should it be travelling under adverse weather and flying conditions. With this point in view radio telephony was introduced, worked up from what was purely a very experimental condition and finally established as one of the chief factors of safety in aerial navigation. The history of its early struggle for development forms interesting reading matter, and can only be appreciated after seeing the results of those earlier efforts in to-day's aircraft telephone sets, and after hearing the conversations between pilots and operators in aircraft with people on the ground.

The route stations maintain a constant watch for aircraft during flying hours, and a quick method of changing over from reception to transmission enables them to reply immediately to any call they may receive. It is a matter of extreme rarity for an aircraft to call one of the ground stations and not obtain an answer at once, unless, of course, the particular station is already engaged with another machine. The converse is also true. With an experience of civil flying, in some cases extending to four years, the aircraft personnel are showing a promptness in answering calls from the ground stations which augurs well for the future of the Services, and should constantly tend to improve the faith of the public in the vast possibilities which aerial travel has opened up. Already there are such signs shown by a decrease of insurance premiums on aircraft and attendant matters.

The wireless control of all commercial aircraft operating on air routes terminating at the London Aerodrome is centred at Croydon, and is the responsibility of the "Traffic Controller," who is constantly to be found in the control tower during flying hours. This control tower in some respects resembles the railroad signal box, and consists of an elevated platform with glass sides, the whole forming a small room which it is possible to see readily over the aerodrome. A smaller room overhead contains certain necessary

instruments. Round the walls of the lower room are situated the various indicators and switches for ascertaining the force and direction of the wind, and for controlling landing lights, together with a gnomonic chart of the areas within wireless range of Croydon, for direction finding purposes. The control tower is the nerve centre of the whole aerodrome, and is the brain of the airway.

The traffic controller is accompanied by a wireless telephone operator whose duty it is to maintain communication with the various aircraft as desired, and to pass instructions to and receive reports from them. A direct telephone line from the operator's table runs to the wireless exchange board in the wireless station, so that the controller's operator is enabled to speak at once to any particular machine without having his attention distracted in manipulating the instruments.

A second operator controls the whole of the running of the power units, transmitter circuits and D.F. receiver, but is not concerned in regulating the traffic. There is, therefore, very little likelihood of any mistake arising due to an operator not being able to concentrate his attention on the work before him. The whole system, further, is duplicated, and should a breakdown occur the station can immediately be brought into action by the emergency sets.

It is possible for the offices of the aircraft companies also to be switched through the wireless station so that they can speak direct to their pilots while flying. It is only on the rarest occasions that this is permitted at the present time however, as if carried out as a regular part of the daily programme it would result in very unnecessary interference to the more important work of control. There is but little doubt, on the other hand, that in the fullness of time, and with the constant improvements which are being steadily added month by month, such "line switching" will one day form a normal feature in air line signalling. But a great deal more research work has yet to be done towards making radio telephony more private and less liable to mutual interference. Carrier waves, generator noises, "wipe-outs," will have to be annihilated. A trustworthy duplex system must be evolved enabling instantaneous two-way speaking and permitting of one speaker interrupting the other. All telephony transmissions will have to be made as highly selective as C.W., unless radio-telephony is to become as troublesome as the now moribund spark systems. These are the immediate problems confronting us.

Apart from the ordinary traffic routine all direction and position finding work is carried out on the 900 metre wavelength. The Croydon station is equipped with an up-to-date Marconi D.F. receiver, modelled on the Bellini-Tosi design, and after some three years of continual experience as the first station of its kind, is capable of giving bearings with a considerably high degree of accuracy. Working by itself it is able to give a bearing to an aircraft immediately upon receiving the request, which is due to the fact that all reception is performed through the D.F. circuits. This has the additional advantage that, in times when several machines are working together, the search coil unit can be used as an extra method of avoiding interference, by the simple expedient of eliminating all but the one machine with which it is desired to communicate. Providing atmospheric conditions are not abnormal, the time taken between the demand for a bearing being made and its receipt by the pilot or navigator, averages less than two minutes. Single bearings are invaluable in guiding a machine to the aerodrome during the last fifty miles. All bearings given are true bearings reckoned from North 000° or 360° , so that the bearing of an aeroplane situated to the East would be 90° , or to the West 270° . By a simple arithmetical process, then, all that a pilot requires to do to reach Croydon is to fly by compass on the reciprocal of the bearing given him, making due allowance for magnetic variation, compass deviation, and the effect of the wind on the direction in which his machine is travelling. With little practice this process of correction becomes almost automatic.

It is not always advantageous for aircraft to navigate solely by single bearings, which give *direction* only, and it adds very greatly to the confidence of everyone concerned if, from time to time, the exact *position* of the different machines is known. The arrangement becomes more popular still if the whereabouts of the aircraft is known at any given minute. Aeroplanes, unlike trains, have no hard and fast route to run on, and the landmarks by which a pilot can recognise his position in fine weather, become invisible when he flies into clouds or fog; and he may very easily lose all idea of his location after a short time. It thus becomes necessary to develop a system by which his position can be determined and given him from the ground.

The term "position finding" as distinct from "direction finding" came to be employed gradually as this process of giving an aircraft its position in distinction to its bearing was evolved. The system necessitated the simultaneous obtaining of bearings by a second station and a rapid comparison of both results on a chart at the main station. After the cessation of activities in airship circles in the late summer of 1921, the Air Ministry's second Civil D.F. station became available for position finding work in conjunction with Croydon. A six months' trial followed, was completely successful, and in May, 1922, the system was adopted as a matter of normal routine. There remains to be seen the value of the subsequent summer's experience, when civil pilots have had the opportunity of flying in fairly good weather conditions, in increasing the reliability and safety of flying during the winter months. Suffice it to be remarked in passing that already one pilot has navigated his machine in fog and mist, the entire distance between Le Bourget (Paris) and Croydon, being out of sight of the ground the whole way, with no other assistance than D.F., and that instances have occurred where lost aircraft have been safely guided to their destination by this method. The appropriate routine and method of procedure is shown elsewhere in the Aircraft Section.

TRAFFIC SIGNALLING.

The reservation of the aircraft wave for purely air to ground and ground to air purposes meant that at least one further wavelength would be needed for dealing with the other traffic signalling. There arose the problem of notifying the arrivals and departures of machines, of passing any instructions to the various terminal airports concerning them, and of handling generally any situation that might from time to time arise and which could not be dealt with on the 900 metre service.

All such messages, relative to the conduct of the air route, became classified together under the heading of Route Traffic messages, and were given the wavelength of 1,400 metres. This wavelength is now commonly known as the Civil Aviation Wave, and on it is carried out every type of terminal point to point signalling. The sending of private telegrams between individuals is, of course, not permitted, but messages relating to official matters or relating to aircraft of the authorised operating air companies are accepted. The Air Ministry Wireless Station, situated in Kingsway, has the sole responsibility for dealing with traffic on this wave. A direct telephone line has been installed between the London Terminal Aerodrome at Croydon and the Air Ministry, and is reserved entirely for civil route traffic signalling. Messages handed in to the appropriate office at Croydon are passed over this line to London where they are checked, and then transmitted direct to the British or Continental addressee. At the moment the Continental Air ports are Le Bourget, Paris; Evere, Brussels; Schipol, Amsterdam; and Cologne. A new one will be in operation in the near future, Guernsey. A similar system of operation at each of these stations is in force, thus ensuring absolute freedom for aircraft to communicate with ground stations abroad as well as at home. At present the airways of Europe are but in the melting pot, but there is bound to emerge at no very distant future

date a series of definitely recognised routes which will all link up together with the existing pioneer routes, and will enable anyone to buy a through ticket to almost anywhere, just as now one takes out a ticket for travel by land or sea. The experience being gained to-day in wireless traffic control and signalling will then prove invaluable.

Messages, relating to traffic, as at present accepted, contain but the barest information concerning the type of machine, its international registration marking, its airport of destination, the time of its departure, the number of passengers, the quantity of merchandise or mail, in the order given, and the time of its departure, in the order given; and it is doubtful whether this form would be improved by alteration or expansion. Brevity stands for increased rapidity. Rapidity is the soul of the air route.

Information current on the 1,400 metre wave for continental air ports and valid for Lympne is passed to that station by a second direct telephone line, thereby obviating the need of a 1,400 metre watch being kept there, and also freeing the wireless system of unnecessary repetitions which might easily hold up important transmissions. On a normal day, especially during the holiday months, route traffic signalling is extremely heavy, and it is very essential to get messages through as expeditiously as possible, since a single delay might, if allowed, disorganise the whole system. Some thousands of words are dealt with daily, and, as a consequence, all unnecessary traffic must be ruthlessly cut out. The same might be said to apply to any signalling service, of course, but on the airway the need is many times greater than anywhere else.

WEATHER SIGNALLING.

Soon after the Armistice, and when the London-Paris route was first being organised, the 1,400 metre wave also carried the meteorological traffic. It will be seen that weather conditions may arise along the airway which render it imperative to divert or to stop traffic altogether. This is the duty of the Controller, but to carry out that duty he must be in full possession of all the weather facts along the routes for which he is responsible. With the increase of traffic came, as a natural sequence of events, an increase of route traffic signalling and a consequent crowding of the 1,400 metre service. An additional wavelength of 1,680 metres was then allocated for air route weather messages. Again, a steady organisation of the method of transmission of these weather telegrams became essential, and at the International Conference the decision was arrived at to consolidate weather reports along the routes for the different points, and to transmit these hourly broadcast. This practice is now carried out at scheduled times every hour by the Air Ministry and by the corresponding foreign stations, and the telegrams are known as Hourly Route Weather Messages. Forecasts are added at the end of such messages giving probable weather conditions for the ensuing hour. These signals are intercepted at the intermediate aerodromes, and are available upon demand for transmission to the pilots of passing aircraft by radio telephony in either an abbreviated or a full form for any portion of the route. These hourly reports and forecasts on 1,680 metres are naturally distinct from the General Synoptic Reports and Inferences which are issued on high power by the Air Ministry Station on 4,100 metres at certain defined periods during the 24 hours, which cover the whole area of the British Isles and forecast weather conditions generally, and by areas, more extensively, and have a much wider application.

ROUTE RECOGNITION MARKINGS.

Every aerodrome has clearly marked out upon it at some convenient spot its name, in large, white letters, clearly visible from a reasonable height or angle. Many of the more important points along the route are also marked in a similar manner. Ashford railway station being an example; and several points off the route are marked as signposts for any pilot who may be uncertain of his route.

For night flying, when these ground signs would be invisible, a series of lighthouses has been installed which function automatically. With nightfall the lighthouses, of their own accord, come into operation with light-signals of varying characteristics for the different localities. With daybreak they automatically extinguish themselves. This system needs attention but twice yearly, and has the important additional value that, should the daylight at any time fall below a pre-determined intensity value, the lighthouse at once comes into action. In very dull or foggy weather, therefore, the lighthouses are always to be found working.

An extensive scheme of "landing lights," for incoming aircraft at night time, is in use at Croydon, being the first of its kind. The whole system is electrically controlled from the control tower, and enables a pilot to perform what would otherwise be a hazardous undertaking with the same degree of accuracy and safety as in broad daylight.

THE FUTURE.

Looking to the future there are things that occur to one's mind as at least possibilities. The immediate necessities in the direction of radiotelephony have been outlined. It must become more and more of the nature of the existing landline telephony, giving immediate two-way working; and its existing capabilities in the direction of causing interference will have to be eliminated. If such prove not to be within the realms of possibility, then, within a comparatively short space of time, when air traffic, carrying wireless, shall have expanded to a somewhat larger scale than that upon which it exists at present, we shall have achieved the limit to the number of aircraft which it is possible to have in the air at once. That is, as far as wireless telephony is concerned, with its existing allotment of one wavelength.

A second, and perhaps equally important matter, and one in which, no doubt, wireless circuits will play a leading part, is that of landing aircraft at any hour of the day or night under any circumstances. It is one thing to bring the aeroplane over the air station by directional wireless, but it is another affair entirely to get that aeroplane into the aerodrome without further aids to skill and good judgment on the part of the pilot. A tremendous service would be rendered to aviation could an instrument for landing an aircraft be devised. That device should be brought into effect from the time D.F. has navigated the machine over the aerodrome until it is safely landed. Several appliances with this object directly or indirectly in view have been unsuccessful, and the field is still open. It is neither necessary nor desirable to crowd into any aircraft large numbers of instruments, but one instrument, capable of putting the aircraft on to the surface of the ground in safety, even in the event of the pilot being taken ill, would be, to say the least, highly valuable. In the meanwhile a method of landing an aircraft in fog, by means of a combination of the principles of sound location and radiotelephony, is being experimentally attempted. A large trumpet capable of being rapidly revolved, and directly accessible from the control tower, picks up the noise of the aircraft's engine and indicates its direction. Simultaneously, by means of low power radio telephony, the traffic officer obtains communication with the pilot of the aircraft, and instructs him to fly to any desired position, meanwhile checking his movements by the sound locator. Having thus manoeuvred the machine into the proper locality for landing, the traffic officer switches on his landing lights.

The questions of increasing the capabilities of aircraft sets, and at the same time decreasing their weight, is one which is receiving the constant attention of many designers; and the rendering of such sets more and more fool-proof and simpler of manipulation becomes a matter of daily routine. The remark that the greater the simplicity the type of the domestic broadcast receiver the larger the liability towards good results

and hence the greater the popular faith in it, is not without its application to the wireless instrument of the commercial aeroplane. There is neither the space nor the time, in any existing type of aircraft, for a complex instrument. The reason why the pilot in many instances is also his own wireless operator is at the moment purely one of safety. In the comparatively small crew spaces available in modern machines there is often hardly suitable spare room for an operator, and neither are there the facilities for immediate intercommunication between pilot and operator. The time is approaching, however, when the advent of larger aircraft will abolish these drawbacks, and doubtless in the huge passenger air liners of the future, long range wireless, with D.F., will be carried, and the routine will be the same as on the present day ocean going liner. For long range purposes, too, wireless telephony will most likely disappear, leaving only telegraphy as being more accurate and less liable to give rise to misunderstandings with any consequent wastage of time; but the organisation adopted for radiotelephony with terminal airports and large intermediate aerodromes looks as if it has come to stay.

Nothing has been mentioned in this article of airships as a commercial possibility. At present they are very much of an unknown quantity, and perhaps, until further experiments and trials are completed, it would be unwise to attempt to forecast their future. Should they ever take to the air again, by reason of their large carrying capacity and ability for long range cruising, they will open up additional possibilities for the aircraft wireless engineer.

And with a steady return to normal conditions and a general easing in the present financial stringency, it will be interesting to see how far these, and many other similar problems, are met and conquered.

B.—REGULATIONS & PROCEDURE —GENERAL.

I.—RADIOTELEPHONY: ORGANISATION AND PROCEDURE.

SECTION I.—GENERAL REMARKS.

1. Radiotelephony equipment in aircraft, operated in conjunction with the system of ground stations, affords an efficient means of controlling air traffic. It enables pilots to report progress *en route*, to obtain meteorological information for any point of their journey, to obtain navigational aid when flying at night or in adverse weather conditions, and, in cases of distress, is an important factor in obtaining assistance. It has the additional utility of enabling inter-communication between aircraft in flight to be effected.

2. The possession of a Postmaster-General's Certificate for Wireless Telegraphy is not necessary to operate radiotelephony installations, but pilots or others using the apparatus must hold the provisional certificate for radiotelephonists issued by the Postmaster-General.

3. Conversation by radiotelephony must be as brief as possible, and for this reason it is desirable that pilots, before leaving the ground, should be in possession of the latest information available at the time of departure. The precaution of "listening-in" must be taken by every aircraft operator prior to making an initial call, in order to ensure that the station called is not already working.

SECTION II.—ORGANISATION.

1. *R/T Ground Stations.*—The radiotelephony stations available for aircraft communication, classified by their respective countries, are shown in Part III of this Notice.

2. *Language.*—When working with continental R/T stations, the language used should be that employed by the ground station worked.

3. *Scope of British Stations.*—The London Terminal Aerodrome station will maintain communication with aircraft as far as the French coast, the Lympne station standing by to relay and assist as and when necessary.

4. *Wavelength.*—The international wave band allocated exclusively for aircraft communication by either radiotelephony or radiotelegraphy is 850-950 metres. The normal wave at present used for such communication is 900 metres. Under certain circumstances, as hereafter shown, the wavelength of 600 metres may be used by aircraft for the transmission of distress signals.

5. *Call Signs.*—The R/T call sign of a ground station is the name of that station, while the international registration mark of an aircraft is also its W/T or R/T call sign. In R/T work, the call sign of an aircraft will always be preceded by the name of the company by which it is operated.

6. *Emergency General Call Signs.*—In cases of emergency, commercial aircraft may call the nearest R.A.F. or Air Ministry civil aviation ground W/T station by using the call sign GEZ (any R.A.F. or Air Ministry civil aviation ground W/T station), and similarly any commercial ground station wishing to communicate with

R.A.F. aircraft can do so by making use of the general call sign GEA (any R.A.F. aircraft). The W/T procedure to be used by commercial aircraft in this connection is shown in the subsection on Procedure. Equivalent call signs have been allocated by the French air authorities as shown:—

FNA .. Any French aircraft.
FNZ .. Any French ground W/T station.

SECTION III.—NATURE OF COMMUNICATIONS.

Communication is confined to matter strictly relative to the control and safety of aircraft, and in this connection the deciding authority regarding the transmission of any message not covered under any of the following headings, is the civil aviation traffic officer. Communication can be classified under the following headings:—

1. *Distress Calls.*—Pending the results of tests now being conducted to determine an international distress word for R/T purposes, a spoken phrase—S.O.S.—will be used as the distress signal, and its use will ensure immediate attention by all stations receiving it. A pilot making a forced landing at sea, when in communication with aircraft R/T ground stations, should make the call three times on the 900 metres wave, followed by as much information (concerning locality, nature of distress, etc.) as time allows. Upon receipt of the distress call the direction finding stations, situated at Croydon and Pulham, will at once take bearing of the aircraft concerned and will report the results to the traffic officer at Croydon, who will take all necessary steps to render immediate assistance, according to the pre-arranged scheme for such occurrences. During the time that Croydon and Pulham are taking such bearings, Lympne will concentrate on getting the whole message, it being observed that Croydon's primary object is to obtain a reliable bearing, an action which may involve the non-reception of portions of the signal.

NOTE.—In the case of an aircraft making a forced landing at sea when employed on special flights which take it out of range of aircraft ground R/T stations, the distress call, S.O.S., should be made on the 600 metres wave, the general ship distress wave. In this case the call should preferably be made on "interrupted continuous wave" transmission by Morse; but if no skilled telegraphist is carried the call may be made on the 600 metres wave by R/T.

2. *Navigational Aids.*—Aircraft in need of navigational assistance can obtain the following aids:—

(a) A position as plotted by bearings taken by two D/F stations.

(b) A bearing of the aircraft taken from a single D/F station.

Full details of the radiotelephony routine for the D/F service are given in the D.F. subsection.

3. *Position Reports.*—Incoming or outgoing aircraft on the continental airways will report when at the following places:—

Biggin Hill.
Tonbridge.
English Coast.
French Coast.

When leaving either coast, aircraft will announce the *intended point of their arrival on the opposite coast.*

4. *Weather Reports.*—

(a) Weather reports giving the latest information from stations on the cross-Channel air routes are available for communication to pilots of machines in flight, upon demand, and are drawn up in the following form:—

Time of Observation.	Place.	General Weather and Warnings.	Visibility.	Height of Lowest Cloud (feet).

(b) Places for which information is available are Biggin Hill, Lympne, Beachy Head, St. Ingelvert, Abbeville, Beauvais, Compiègne, Le Bourget, Brussels, Ostend, Flushing, Rotterdam and Schiphol. Under certain bad weather conditions, reports for Grain, Deal and North Foreland, will be added.

(c) Pilots asking for "weather report for that place." will be given the whole information for that place. The R/T operator in replying will follow the set order and will not read out the headings. To avoid confusion between visibility and cloud height, it should be noted that distance of visibility is always given in yards or miles and that height of lowest cloud is always given in feet. On the other hand, should the pilot ask for "Croydon visibility," the reply would be in the form "0800 Croydon 4,000 yards."

(d) In addition to the above-mentioned items, information relating to wind at various heights and places will also be available, but, as a rule, a delay of a few minutes will be necessary whilst such data, if requested, are being prepared.

5. *Report of Adverse Weather.*—Pilots *en route* encountering adverse weather conditions, of which no mention is made in the latest weather report, should transmit appropriate information to the nearest ground station for the benefit of other aircraft operating over the same route.

SECTION IV.—PROCEDURE.

1. The procedure herein laid down is applicable to both ground stations and aircraft. It has been compiled in the light of experience and legislates for air traffic on an average flying day.

It is essential that the correct procedure be adhered to by all concerned at all times, for, although irregularities may possibly cause no apparent delay or disorganisation when only one aircraft is flying, such irregularities will cause serious consequences when several aircraft are communicating. The Croydon R/T station is the controlling station for all R/T work on 900 metres wave within the British Isles, and, as such, its orders must be obeyed.

2. In the following paragraphs are shown examples of R/T communication between Croydon station and an aircraft belonging to the fictitious company, "Continental Airways, Ltd.," and flying from London to Paris. These examples give the correct procedure respecting all subjects upon which communication is necessary, with the exception of direction finding procedure, which is dealt with fully in the D.F. sub-section.

3. *Procedure on Leaving the Aerodrome.*—The aircraft on leaving the aerodrome calls the ground station and passes a message (see paragraph 4) giving its registration marking, its aerodrome of departure, and its destination.

(a) *Calling up.*

"Hullo Croydon, Hullo Croydon, Continental GEXYZ calling, Continental GEXYZ calling, over."

When re-making an initial call, the call signs of both the station called and of the station calling are made twice. Communication once having been established, call signs are transmitted once only.

(b) *Answering.*

The ground station replies:—

"Hullo Continental GEXYZ, Hullo Continental GEXYZ, Croydon answering, Croydon answering, over."

4. *Passing a Message.*

The aircraft continues:—

"Hullo Croydon, Continental GEXYZ calling, London to Paris, Continental GEXYZ, London to Paris, over."

The ground station replies:—

"Hullo Continental GEXYZ, Croydon answering, understand you are bound for Paris, understand you are bound for Paris, is that correct? over."

To which the aircraft answers:—

"Hullo Croydon, Continental GEXYZ answering, that is correct, that is correct, switching off."

This signal and its acknowledgment by the ground station afford a test of the machine's R/T apparatus, and enable the aircraft to tune its receiver and obtain all necessary adjustments.

NOTE (i). Messages in every case are transmitted twice, repeated by the receiving station, and confirmed by the sending station.

NOTE (ii). During communication the word "over" terminates each transmission. The words "switching off" indicate that communication is finished.

5. *Position Report.*—The aircraft, upon reaching Biggin Hill (a reporting point):—

"Hullo Croydon, Continental GEXYZ calling, passing Biggin Hill, passing Biggin Hill, over."

Croydon answers:—

"Hullo Continental GEXYZ, Croydon answering, understand you are passing Biggin Hill, understand you are passing Biggin Hill, is that correct? over."

To which the aircraft answers:—

"Hullo Croydon, Continental GEXYZ answering, that is correct, that is correct, switching off."

The machine proceeds to Tonbridge, the next reporting point, where a similar message to the above is passed.

6. *Request for Weather Report.*—The weather being unsettled the pilot may desire information regarding conditions on the French coast, prior to crossing the Channel. The request is made thus :—

"Hullo Croydon, Continental GEXYZ calling, give me weather report for French coast, give me weather report for French coast, over."

The operator at Croydon thereupon transmits the most recent report for St. Inglevert :—

"Hullo Continental GEXYZ, Croydon answering, weather report for 0800 St. Inglevert, slight drizzle, 3 miles, 1,000 feet, weather report for 0800 St. Inglevert, slight drizzle, 3 miles, 1,000 feet, over."

This is received, duly acknowledged by the aircraft, and confirmed by the ground station.

7. *Report on Leaving Coast.*—The pilot of GEXYZ, considering the report satisfactory, leaves the English coast, reporting thus :—

"Hullo Croydon, Continental GEXYZ calling, now leaving Dover for Gris-Nez, now leaving Dover for Gris-Nez, over."

Croydon repeats message correctly, and the aircraft operator confirms it.

8. *Report of Adverse Weather.* In Mid-Channel adverse weather conditions are encountered and reported by the pilot in the following manner :—

"Hullo Croydon, Continental GEXYZ calling, clouds down to 200 feet in Channe, heavy rain squalls, clouds down to 200 feet in Channel, heavy rain squalls, over."

On receipt of this signal the operator at Croydon at once notifies the Meteorological Office there.

9. *Report on reaching French Coast.*—The pilot, on reaching the French coast, again reports position, and here the R/T work of the British stations ceases nominally, the French stations thereafter taking over control.

10. *Example of Distress Call.*—The following is an example of the procedure to be adopted in making a distress call by R/T on the 900 metres aircraft wave :—

SOS, SOS, SOS, continental GEXYZ, engine trouble, about 5 miles north of Gris-Nez, SOS, SOS, etc."

This signal is made as frequently as time allows, and should give as much information as possible regarding nature of distress, position, etc. All ground stations and aircraft hearing this call immediately cease any R/T work upon which they may be engaged, and concentrate upon receiving the full message from the distressed aircraft. The Croydon and Pulham D/F stations plot the machine's position, and report it to the Croydon traffic officer, who takes all steps with the necessary authorities to render assistance according to the pre-arranged scheme.

11. *Failure to Receive.*—Failure to receive acknowledgements should not deter an aircraft from transmitting. For instance, an aircraft may develop a fault in its wireless receiver, in which case it should not fail to continue reporting its positions at the points along the route laid down above. At the same time great care must be taken to avoid unnecessary transmission.

12. *Phonetic Alphabet.*—The following phonetic alphabet is used by Government civil aviation stations :—

A = Ac.	N = Nuts.
B = Beer.	O = Orange.
C = Charlie.	P = Pip.
D = Don.	Q = Queen.
E = Edward.	R = Robert.
F = Freddie.	S = Sugar.
G = George.	T = Toc.
H = Harry.	U = Uncle.
I = Ink.	V = Vic.
J = Johnnie.	W = William.
K = King.	X = X-ray.
L = London.	Y = Yorker.
M = Monkey.	Z = Zebra.

This alphabet should be used whenever it may become necessary to have recourse to spelling word during radiotelephonic conversations.

C.—REGULATIONS & PROCEDURE— DIRECTION FINDING.

II.—WIRELESS DIRECTION FINDING SERVICES : BRITISH ISLES, FRANCE, GERMANY AND ITALY.

GENERAL REMARKS.

1. Since, in giving an aircraft a bearing, reference is made to the time at which the readings are taken, it is essential that the aircraft's watch should be absolutely accurate. If there is any doubt as to the accuracy of the watch, a check should be at once carried out by calling the nearest route ground station, and obtaining the exact time (G.M.T. or B.S.T., as the case may be).

2. In order to avoid unnecessary interference and any consequent confusion or delay, an aircraft operator must invariably "listen in" before calling a station, to ensure that that station is not already engaged.

3. The D/F stations available for use by aircraft and the procedure to be employed are grouped by countries hereunder.

SECTION I.—BRITISH ISLES.

(a) Stations.

See also Directory Section—Land.

Croydon	.. Aircraft only.
Pulham	.. Aircraft only.
Berwick	..
Flamborough	.. 20 ¹ / ₂ , 310 yds. from Flam- borough Head Lighthouse.
Lizard	..

(b) Telephony Procedure.

(i) *In conjunction with Croydon and Pulham.*—The procedure, when using R/T, for an aircraft desiring to obtain its position by means of cross bearings from Croydon and Pulham, is as follows :—

Example.

Aircraft GEXYZ belonging to "Continental Airways, Ltd.," wishes to ascertain its position.
1st Action.

Aircraft calls Croydon and asks for its position :—

"Hullo Croydon, Continental, GEXYZ calling, position required, position required, over."

2nd Action.

Croydon replies :—

"Hullo Continental, GEXYZ, Croydon answering, Righto, Righto, please speak now for half a minute."

(In the event of other aircraft talking Croydon will order them to cease work until called, and THEY SHOULD IMMEDIATELY DO SO.) The reply "Righto" means that the stations are ready to take the bearings.

3rd Action.

The aircraft operator then speaks for half a minute, remembering that Croydon is paying no attention to the actual words, and would not, therefore, hear if anything of importance were passed.

4th Action.

Pulham takes a bearing and passes it to Croydon.

5th Action.

Croydon takes a bearing, plots the position of the aircraft in conjunction with Pulham's bearing, and continues :—

"Hullo Continental GEXYZ, Croydon calling, at 1509 position 2 miles north of Canterbury, at 1509 position 2 miles north of Canterbury, over."

6th Action.

Aircraft replies :—

"Hullo Croydon, Continental GEXYZ answering, at 1509 position 2 miles north of Canterbury, at 1509 position 2 miles north of Canterbury, GEXYZ over."

7th Action.

Croydon replies :—

"Hullo Continental GEXYZ, Croydon answering, position correct, position correct, switching off."

NOTE.—In the event of repetitions being required by Croydon or Pulham, these will be asked for by Croydon only. Pulham will only communicate direct with an aircraft when it is flying north of London and is out of range of Croydon.

(ii) *In conjunction with either Croydon or Pulham only.*—The procedure, when using R/T, for an aircraft desiring to obtain a single bearing from Croydon or Pulham is as follows :—

Example.

Aircraft GEXYZ wishes to obtain a bearing from Croydon.

1st Action.

Aircraft GEXYZ calls Croydon and asks for its bearing :—

"Hullo Croydon, Continental GEXYZ calling, bearing required, bearing required, over."

2nd Action.

Unless Croydon has already obtained a satisfactory bearing that station replies :—

"Hullo Continental GEXYZ, Croydon answering, Righto, Righto, please speak for half a minute, over."

3rd Action.

The aircraft then speaks for half a minute, remembering that Croydon is paying no attention to the actual words, and would not, therefore, hear if anything of importance were passed.

4th Action.

Croydon replies :—

"Hullo Continental GEXYZ, Croydon answering, bearing 110 degrees at 1509, bearing 110 degrees at 1509, over."

5th Action.

The aeroplane replies :—

"Hullo Croydon, Continental GEXYZ answering, got bearing 110 degrees at 1509, GEXYZ, got bearing 110 degrees at 1509, over."

6th Action.

Croydon replies :—

"Hullo Continental GEXYZ, Croydon answering, bearing correct, bearing correct, switching off."

(c) Morse Procedure.

(i) The following abbreviations are to be used :—

Signal	Meaning.
QTE ?	"What is my true bearing from you (or from) ?"
QTE	"Your true bearing from me (or from) was..... degrees."
QTF ?	"What is my position determined by cross bearings from..... ?"
QTF	"Your position determined by cross-bearings from..... is....."
QSY ?	"Shall I transmit with a wavelength of..... metres ?"
QSY	"Change over to wavelength of..... metres."

(ii) *In conjunction with Croydon and Pulham.*

Example.

An aircraft GEXYZ using Morse procedure requires to ascertain its position as determined by cross bearings from Croydon and Pulham.

1st Action.

The aircraft calls Croydon :—

"CT GED GED GED de GEXYZ
GEXYZ GEXYZ QTF UD QTF UD AR."

2nd Action.

Croydon communicates with Pulham, and when the latter station is ready, makes to the aircraft :—

"CT GEXYZ de GED K."

3rd Action.

On receipt of "K" the aircraft then makes :—

"CT GED de GEXYZ GEXYZ, etc.
(for 30 seconds)....GEXYZ."

4th Action.

During this transmission Pulham takes a bearing and calls Croydon :—

"CT GED de GEP QTE GEXYZ 182 at
1509 AR."

5th Action.

Croydon determines the position of the aircraft with her own and Pulham's bearing, and replies to the aircraft :—

"CT GEXYZ de GED QTF 2 miles north
of Canterbury at 1509 AR."

6th Action.

In order to confirm to Croydon that the aircraft has received the position correctly, she will repeat it back to Croydon:—

"CT GED de GEXYZ QTF 2 miles north of Canterbury at 1509 AR."

7th Action.

If the aircraft has received the position correctly Croydon will acknowledge, making the "end of work sign":—

"CT GEXYZ de GED R VA."

NOTE.—In the event of repetitions being required by Croydon or Pulham, these will be asked for by Croydon only. Pulham will only communicate with an aircraft direct when it is flying north of London and is out of range of Croydon.

The procedure for obtaining a single bearing from one station only is similar to that outlined in the 1st Action of the above example, except that QTF is replaced by QTE.

(iii) In conjunction with other Ground Stations.

In the case of the other ground stations, if cross bearings are required to determine an aircraft's position, the stations should be called up together and the bearings taken in one operation. The aircraft calls the station or stations on the appropriate wave, making "QTE?" in conjunction with the call signals of the stations from which bearings are required. The station or stations called, when ready, answer in alphabetical order of their call signs, and make "K" ("go on").

Example.

An aircraft, whose call sign is GEXYZ, required a bearing from Berwick (BVG) and Flamborough (BVN).

1st Action.

The aircraft makes on 450 metres:—

"CT BVG BVG BVN BVN de GEXYZ GEXYZ QTE UD AR."

2nd Action.

On receiving "K" from each station, the aircraft makes her own call signal for 60 seconds, and awaits the result.

3rd Action.

The stations reply (in alphabetical order of call signs) either asking the aircraft to repeat (UD) or giving the result. The result is given by the signal QTE, followed by the call signal of the D/F station, and by a group of three figures (000 to 359), indicating the true bearing from 000° to 359° of the aircraft from the station, reckoning clockwise from North (e.g. North = 000°, West = 270°). The result is given in the form:—

"CT GEXYZ GEXYZ de BVG 9.45 M (time) BT QTE BVG 092 AR."

followed by:—

"CT GEXYZ GEXYZ de BVN 9.45 M (time) BT QTE BVN 045 AR."

4th Action.

The aircraft, on receiving the result, acknowledges receipt in the ordinary way, repeating the bearing received from each station and makes VA ("end of work" sign). This sign is then repeated by the stations concerned. It is important that the "end of work" sign should not be omitted, since it not only indicates that the operation is finished, but it also shows that all concerned are about to resume normal watch.

NOTE.—The letter M or S, following the time in the bearing signal denotes that the time stated is A.M. or P.M. respectively.

(d) General.

It should be noted that R/T will not normally be used for D.F. purpose for communicating with stations other than Croydon and Pulham.

SECTION II.—FRANCE.

(a) Stations.

See also Directory Section—Land.

Bernieres ..	—
Berre ..	—
Bizerte ..	—
Brest-Moulin du Seigneur	Service temporarily suspended.
Casablanca D.F. (Morocco)	Replies through Casablanca (CNP).
Cherbourg ..	The D.F. station works in conjunction with the ordinary W.T. traffic station.
Gris-Nez ..	—
Kenitra (Morocco)	—
Lorient ..	—
Marseille ..	—
Ouessant-Pen ar Roch	Replies through Ouessant (FFV)
Penmarch ..	—
Pointe du Raz	—
St. Nazaire ..	—
Soubise (Rochefort)	—
Toulon-la-Mitre	—
Treguier St. Gonerly	—

(b) General.

French D/F stations of small power keep watch on the wavelength of 600 metres; this wave must be used in all cases by aircraft for calling French ground stations in order to obtain bearings.

The ground station called replies on the 600 metres wave. The wave upon which the bearing is given can be either 450 metres or 800 metres, at the choice of the aircraft, which choice should be indicated in making the first call. The wavelength of 600 metres can be similarly utilised by aircraft which are not able to transmit and receive on 450 metres or 800 metres.

The results of observations are transmitted by the ground station on whichever wave is chosen. It should be noted, however, that Toulon and Casablanca always transmit bearings on 800 metres, irrespective of the wavelength upon which the bearing is taken.

The charge in respect of each bearing sent out by a French D/F station is six francs. The charges will be collected in the same manner as for wireless telegrams originating from ships.

(c) Procedure.

(i) The procedure is similar to that laid down for British D/F stations. The abbreviations to be used are :—

QTE ? "What is my true bearing from you (or from.....) ?"

QTE "Your true bearing from me (or from.....) is....."

The bearings are indicated by a group of three figures from 000 to 359, reckoning clockwise from North (North = 000°, West = 270°).

The procedure is to be observed as follows :—

1st Action.

The aircraft calls the station, or stations, on 600 metres, and transmits the signal "QTE ?" followed by the call signs of all the stations from which it requires bearings, and giving the wavelength upon which it desires the bearings to be given. It then listens in on 600 metres

2nd Action.

The ground stations called prepare to take bearings and, when ready, reply in alphabetical orders of their call signs, instructing the aircraft, by the signal "K," to commence its transmission; the letter "K" is followed by a number giving the strength of the aircraft's signals as received by the ground station.

3rd Action.

On receiving the signal "K" the aircraft adjusts its transmitting gear to the wavelength chosen and transmits its call sign for 50 seconds. It then "listens in" on that wave.

4th Action.

The stations reply in alphabetical order of their call signs, either asking for the aircraft signal to be repeated, or giving the results of their observations by the signal "QTE" followed by a group of three figures indicating the bearing.

Example.

An aircraft GEXYZ requires bearings from Moulin du Seigneur (FEI) and Ouessant-Pen ar Roch (FEO). It desires to use the wavelength of 450 metres. The different operations will take place in the following order :—

1st Action.

GEXYZ calls the two stations on 600 metres :
"VE FEI FEI FEO FEO V GEXYZ
QTE ? FEI FEO 450 AR."

2nd Action.

GEXYZ having transmitted this signal listens on 600 metres.

3rd Action.

FEI replies on 600 metres :—

"VE GEXYZ V FEI 450 K6."

4th Action.

FEO replies on 600 metres :—

"VE GEXYZ V FEO 450 K7."

5th Action.

FEI and FEO adjust their instruments to 450 metres.

6th Action.

GEXYZ adjusts its transmitter to 450 metres and signals :—

"VE FEI FEO V GEXYZ GEXYZ
GEXYZ.....(for 50 seconds) AR."

7th Action.

GEXYZ having transmitted this signal listens on 450 metres.

(the two stations having made their observations have, say, obtained the following results at 1545 G.M.T. :—
FEI 330° FEO 093°.)

8th Action.

FEI thereupon signals on 450 metres :—

"VE GEXYZ V FEI I BT 1545 QTE
330 AR FEI."

9th Action.

GEXYZ having received this signal acknowledges receipt by transmitting :—

"VE FEI V GEXYZ R II VA."

10th Action.

FEO transmits on 450 metres :—

"VE GEXYZ V FEO 3 BT 1545 QTE
010 AR FEO."

11th Action.

GEXYZ having received this signal acknowledges receipt by sending :—

"VE FEO V GEXYZ R II VA."

12th Action.

The stations repeat VA, and then all resume their normal watch.

NOTE.—The numbers 1 and 3 having the sign BT represent the number of the record on the stations' registers. The number 1545 refers to the Civil Mean Time of the Meridian of Greenwich.

If one of the stations (FEO for example) desires repetition, not having obtained a correct observation on the first transmission, it makes the signal :—

"VE GEXYZ V FEO UD."

The aircraft then repeats the transmission of its call sign for a further 50 seconds, after which the remainder of the operation is as described above.

SECTION III.—GERMANY.

(a) Stations.

See also Directory Section—Land.

Borkum	..	—
List	..	—
Nordholz	..	—
Wilhelmshaven	Control Station.	

(b) Procedure.

The stations belong to the State Marine, and are available for public use only when not in use by the Navy.

An aircraft requiring bearings should call Wilhelmshaven W/T station on a damped wave of 600 metres. That station makes the necessary arrangements with the D/F stations, and communicates the bearings or the position ascertained in latitude and longitude to the aircraft concerned. The D/F stations correspond with aircraft of other countries only through Wilhelmshaven station.

Example (i).

1st Action.

The aircraft calls the control station on 600 metres, and having established communication makes :—

"CT KAN de GEXYZ BT QTE QSY
600 AR."

2nd Action.

The control station answers and tells the aircraft to wait :—

"CT GEXYZ de KAN VE AS."

3rd Action.

The control station calls the three D/F stations on another wave, and, when they are ready to take bearings, makes :—

"CT GEXYZ de KAN BT BITTE VV
GEBEN AR" ("Please send V's").

4th Action.

The aircraft then sends V's as requested :—

"CT KAN de GEXYZ BT V's (for 60
seconds) GEXYZ AR."

5th Action.

The control station collects the results on a different wave, and transmits them to the aircraft :—

"CT GEXYZ de KAN BT QTE 1018
(time) BT KBO 012 (bearing) BT KBQ
247 BT KAO 350 VE UD AR K."

6th Action.

If the aircraft has received the bearings, she replies :—

"CT KAN de GEXYZ VE VE AR VA."

7th Action.

The control station then makes :—

"CT GEXYZ de KAN VE VE VA."

NOTE.—In the event of the aircraft requiring a repetition of the bearings, UD will be substituted for VE in the 6th Action above.

Example (ii).

An aircraft (call sign GEXYZ) requiring to ascertain her position by means of bearings from the three stations, the following procedure is to be employed :—

With the exception that QTF is substituted for QTE, the procedure is as in the first four Actions of Example (i) above until the three stations have passed the bearings to KAN.

5th Action.

KAN then makes to GEXYZ :—

"CT GEXYZ de KAN BT QTF 1018
(Your position at 1018) IST.....
GRAD (is.....degrees.....)
MIN.....SEK NORD-BREITE.....
(mins.....secs.....north latitude).....
GRAD.....MIN.....SEK.....
OST-LANGE.....(degrees.....
minutes.....seconds.....cast
longitude) AR K."

6th Action (et seq).

The procedure is then as in the last two actions of Example (i) above.

NOTE.—Mid-European time is used, the hours and minutes being expressed in four figures from 0001 to 2359.

SECTION III.—ITALY.

(a) Station.

See also Directory Section—Land.

Murano

NOTE.—Bearings from this station are to be obtained by calling Carbonera (ICZ) on 600 metres, and are transmitted for Murano by Carbonera.

A charge of six francs is made for each bearing transmitted by an Italian W/T D/F station. The charges are collected in the same manner as for wireless telegrams originating from ships.

(b) Procedure.

The procedure is as follows :—

An aircraft whose call signal is GEXYZ wishes a bearing.

1st Action.

On a wave of 600 metres she will signal :—

"CT ICZ ICZ de GEXYZ QTE ?"

2nd Action.

Carbonera will answer :—

"CT GEXYZ de ICZ AS."

3rd Action.

Carbonera then wires Murano; when ready, Carbonera replies :—

"CT GEXYZ de ICZ K."

4th Action.

GEXYZ after 30 seconds signals :—

"CT ICZ de GEXYZ GEXYZ GEXYZ,
etc." for 45 seconds.

(If dissatisfied with the bearing, Murano through Carbonera, will ask the aircraft to repeat.

Carbonera signals :—

"CT GEXYZ de ICZ UD."

GEXYZ repeats the signal as given above.)

5th Action.

When satisfied with the bearing, which is assumed to be 170° at 9.45, Murano will transmit it by telegraph to Carbonera, whence it is passed to the aircraft as follows :—

"CT GEXYZ de ICZ de IRM 9.45 M BT
QTE 170 AR ICZ."

6th Action.

GEXYZ acknowledges receipt :—

"CT ICZ de GEXYZ R VA."

D.—AVIATION STATIONS.

III.—WIRELESS TELEGRAPHY STATIONS IN OPERATION IN CONNECTION WITH CIVIL AIR ROUTES.

GENERAL REMARKS.

The information given in these tables relates only to stations, either situated actually upon aerodromes, or whose routine is directly concerned with flying operations and is primarily intended for aircraft.

Certain routine transmission by these stations are only carried out during that portion of the year when additional air services are being run owing to longer periods of daylight. Such transmissions are shown hereafter marked with an asterisk.

Details of those W/T stations whose meteorological routine is not primarily intended for aircraft, but which may indirectly have bearing

upon the operation of the air routes, are given in Meteorological Office Publication 252, which can be obtained from H.M. Stationery Office, or directly from the Meteorological Office, Air Ministry, price 2s. 6d.

The procedure to be adopted for W/T (Morse) communication between aircraft and the ground stations of the countries hereafter mentioned is as laid down in the "Handbook for Wireless Telegraph Operators of H.M. Postmaster-General" obtainable through any bookseller or from H.M. Stationery Office, price 6d.

Unless otherwise stated all stations use a C.W. system, and all times quoted are G.M.T.

SECTION I.—BRITISH ISLES.

Bordeaux	1300 1500	<i>Route Traffic Messages as necessary.</i> <i>Meteor. Messages.</i>
Dijon	1400	<i>Traffic as necessary.</i> <i>Meteor. Messages at 0715, 0945, 1315.</i>

SECTION III.—FRANCE—continued.

Station.	Wavelength in Metres.	Routine.
Lyon	1400	Route Traffic Messages as necessary. Meteor. Messages at 0640, 0710, 0940, 1310, 1800.
Marignane .. .	1680	Route Traffic as necessary. Meteor. Messages at 0724, 0953, 1324, 1824.
Montelimar .. .	1680	Meteor. Messages only at 0700, 0930, 1300 and 1800.
Nancy	1400 1450	Traffic as necessary. Meteor. Messages at 0515, 0615, 0715, 0915, 1015, 1115, 1315 and 1815.
Nîmes	1680	Traffic as necessary. Meteor. Messages at 0706, 0936, 1110, 1306, 1806.
Perpignan .. .	1300	Traffic as necessary. Meteor. Messages at 0710, 0910, 1110, 1310, 1810.
Romilly-sur-Seine ..	1400	Traffic as necessary. Meteor. Messages at 0618, 0718, 0818, 0918, 1018, 1118, 1318.
Strasbourg .. .	1400 1720 1720 or 2500	Traffic as necessary. Meteor. Messages at 0505, 0605, 0710, 0905, 1005, 1305 and 1805. Traffic with Prague.
Toulouse... ..	1300	Traffic as necessary. Meteor. Message at 1105.
Valenciennes .. .	1200 1400	Route Traffic as necessary. Hourly Meteor. Messages at 0540, 0605, 0705, 0805, 0905, 1105, 1205, 1305, 1405, 1505, 1605.

SECTION IV.—HOLLAND.

Station.	Wavelength in Metres.	Routine.
Soesterberg .. .	900 1400 1680 1900	Radiotelephonic communication with aircraft in flight. Route Traffic Messages. Meteor. Route Messages are issued daily at 0745, 0845, 0945, 1045, 1145, 1245, and 1345. 0730, 1005, 1330, 1505, 1830.
Schiphol (Air Port of Amsterdam) .. .	900	Radiotelephonic communication with aircraft in flight.
Rotterdam	900	Radiotelephonic communication with aircraft in flight.

UNITED STATES OF AMERICA.

The Postal Radio Service is owned and operated by the Post Office Department.

The United States Air Mail Service has been experimenting with aircraft radio since February, 1919. Its principal efforts have been directed to the solution of the problem of Radio Direction Finding and Radio Field Localising. The solution of these problems has been pursued with the aid of the Bureau of Standards and data furnished by the Navy Department, with considerable original research by the Air Mail Service. A simplified Radio Direction Finder, based on the Robinson principle of fixed A and B coils, was evolved, and has been practically applied to single-manned planes of this service. Pilots with no previous experience have flown directly over the radio stations at destination by this means.

The problem of field localising jointly solved by the Air Mail Service and the Bureau of Standards, has resulted in the discovery and practical application of the so-called Radio Frequency

Field Localiser System. This system in brief, consists of two large horizontal single-turn coils in which radio frequency currents flow in opposite directions. As a result, the electro-magnetic field extends upward in an expanding cone. An aeroplane utilising radio direction finding during periods of poor visibility can, of course, fly to the vicinity of the landing field. From this point the field localiser directs them to the immediate vicinity of the field itself.

During August, 1920, it was found that telegraph communication could not be furnished for the trans-continental Air Mail Service. As a result, it was decided on August 20th to install a chain of radio stations across the continent, tying in each of the Air Mail Fields.

There are eleven of these stations installed on or near various Air Mail fields. Those in operation are (1) College Park, Md., 2 kw. Quenched Spark; (2) Bellefonte, Pa., 5 kw. Quenched Spark; (3) Omaha, Neb., 6 kw. Quenched Spark; (4) Cheyenne, Wyo., 2 kw. Arc.

Stations located at the following points have been in operation since October 15th :—(1) Salt Lake City, Utah, 2 kw. Arc; (2) Elko, Nevada, 2 kw. Arc; (3) Reno, Nevada, 2 kw. Arc. The following stations were completed on November 1st 1920 :—(1) St. Louis, Mo., 5 kw. Quenched Spark; (2) North Platte, Nebr., 2 kw. Arc; (3) Rock Springs, Wyo., 2 kw. Arc.

These stations are not only used for inter-station traffic, but are also utilised for aeroplane radio communication and radio direction finding.

It is proposed to utilise all the radio stations of the Air Mail Service for Radio Research work, such as investigation of shifting signals, static and other kindred problems.

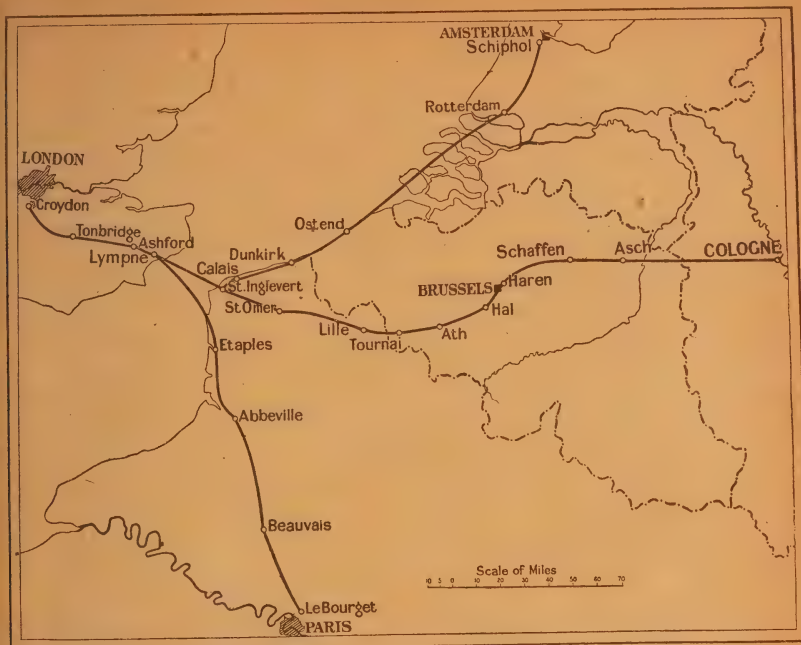

GERMANY.

The Koenigs Wusterhausen Station (Call Letters, LP) sends out notices for aircraft on a 3,600-metre wave at 1000 and 2000.

Additional information relating to Aircraft Wireless is contained in the Laws and Regulations section.

AIR MINISTRY CIVIL AVIATION RADIO STATIONS.

MAP OF THE LONDON TO PARIS, BRUSSELS, COLOGNE AIRWAYS.

E. TABLE OF MARKS

The nationality mark of the State named below applies to the aircraft of its Dominions, Colonies, Protectorates, Dependencies, or of countries of which it is the Mandatory Power.

Country.	Nationality Mark.	Registration of Marks.
United States of America	N	All communications made in accordance with the provisions of Section 1 (4) using a group of four letters out of the 26 of the alphabet, each group containing at least one vowel—e.g., ADCJ, PURN.
British Empire	G	
France	F	
Italy	I	
Japan	J	All communications made with B as first letter. <div> <div> <div>..</div> <div>..</div> <div>..</div> <div>..</div> <div>..</div> <div>..</div> <div>..</div> <div>..</div> <div>..</div> <div>..</div> <div>..</div> <div>..</div> <div>..</div> <div>..</div> <div>..</div> <div>..</div> <div>..</div> <div>..</div> <div>..</div> <div>..</div> <div>..</div> <div>..</div> <div>..</div> </div> <div> <div>C</div> <div>P</div> <div>R</div> <div>U</div> <div>B</div> <div>G</div> <div>L</div> <div>B</div> <div>P</div> <div>B</div> <div>P</div> <div>C</div> <div>H</div> <div>S</div> <div>S</div> <div>E</div> <div>G</div> <div>P</div> <div>H</div> </div> <div> <div>..</div> <div>..</div> <div>..</div> <div>..</div> <div>..</div> <div>..</div> <div>..</div> <div>..</div> <div>..</div> <div>..</div> <div>..</div> <div>..</div> <div>..</div> <div>..</div> <div>..</div> <div>..</div> <div>..</div> <div>..</div> <div>..</div> </div> </div>

USEFUL DATA

WIRELESS TERMINOLOGY

(i) DEFINITIONS.

AERIAL.—The system of conductors designed to radiate or absorb electro-magnetic waves.

AERIAL, DIRECTIONAL.—An aerial having the property of radiating or absorbing energy better in some directions than in others.

AERIAL, PLAIN.—An aerial in which the oscillations are produced by its own discharge, instead of being induced from another circuit.

ÆTHER.—See Ether.

AMPLIFIER.—An instrument which modifies the effect of a local source of energy in accordance with the variations of received energy, and in general produces a larger indication than could be had from the incoming energy alone. The triode is the most perfect amplifier of both high and low frequencies.

AMPLIFICATION, CO-EFFICIENT OF.—The ratio of the useful effect obtained by the employment of the amplifier to the useful effect obtained without that instrument. In particular the amplification constant of a triode may be defined as the ratio of the slopes of the grid voltage-anode current and the anode voltage-anode current characteristics at any operating point.

AMPLITUDE.—The maximum value of current or voltage attained during any half period of an alternating current or voltage.

ANODE.—The electrode by which the current enters the liquid or space within a vessel. Thus the anode is the negative plate of a primary cell, but the positive electrode of any other apparatus.

ANTENNA.—See Aerial.

ANTINODE.—A point of maximum amplitude on a stationary wave.

APERIODIC CIRCUIT.—A circuit which has no definite time period; this being due either to its resistance being larger than the critical resistance, or to its having no capacity or no inductance, and therefore no oscillatory properties.

ARC.—A luminous discharge of electricity through a gas in which the material of one or both of the electrodes is volatilised and takes part in the conduction of the current, whether continuous or alternating.

ARRESTER, EARTH.—A spark gap with a small gap and large sparking surfaces; used to protect receiving apparatus from powerful discharges.

ASYNCHRONOUS.—Rotating at a speed which has no fixed relation to some other speed, or to the frequency of some alternating current.

ATMOSPHERIC ABSORPTION.—That portion of the total loss of radiated energy due to atmospheric conductivity.

ATMOSPHERICS.—Electromagnetic waves produced by disturbances in the atmosphere or in the earth's surface.

ATTENUATION, CO-EFFICIENT OF.—The co-efficient which, when multiplied by the distance of transmission, gives the natural logarithm of the ratio of the amplitude of the electric or magnetic force at that distance to the initial value of the corresponding quantity.

AUDIO.—See Frequency, Audio.

AUDION.—De Forest's three-electrode valve.

AUTODYNE.—Another name for "self-heterodyne."

AUTO-TRANSFORMER.—A transformer in which the primary and secondary windings are tapped off the same coil and have a number of turns in common.

BALANCING AERIAL.—An aerial used in duplex wireless telegraphy to eliminate the effect of the local transmitter.

BEAT.—When two oscillations of slightly different frequencies are impressed on an electrical circuit, they periodically help and oppose each other. The result is an oscillation, the amplitude of which varies in a regular and periodic manner. The time between two successive maxima of amplitude is called the period of the beat. The beat frequency is equal to the difference of the frequencies of the component oscillations.

BUZZER.—A make and break producing weak oscillations which are very convenient for testing purposes.

CAPACITY.—That property of a material by virtue of which it is capable of storing energy electrostatically. The capacity of a system is dependent on its geometrical dimensions, its position relative to other conductors and the dielectric constants of the surrounding media.

CATHODE.—The electrode by which the current leaves the liquid or space within a vessel. Thus the cathode is the positive element of a primary cell, but the negative electrode of any other apparatus.

CHOKE.—A coil with large inductance and small resistance designed to prevent the passage of alternating current, but to permit the passage of continuous current.

CIRCUITS, CLOSED AND OPEN.—A closed oscillating circuit is one in which the capacity and inductance are substantially localised in different places, while an open radiating or absorbing circuit, though it may have additional localised capacity and inductance, contains the aerial with the capacity and inductance distributed throughout its length.

COHERER.—An early form of detector consisting of a contact or collection of contacts which cohere or become relatively conductive under the stimulus of an oscillating potential.

COMPASS, RADIO.—Another name for "Direction-finder."

COUNTERPOISE.—A system of electrical conductors forming one portion of a radiating oscillator, the other portion of which is the aerial. In land stations, a counterpoise forms a capacity connection to earth.

COUPLING.—The connection between two circuits by which energy is transferred from one to the other. The connection may be by magnetic, electro-static or direct coupling, or by any combination of these.

COUPLING, Co-EFFICIENT OF.—In inductively coupled circuits the ratio of the mutual inductance to the square root of the product of the separate self-inductances. The co-efficient of coupling (k) between any two circuits tuned to the same frequency and then coupled is given by the formula :—

$$k = \frac{\lambda_1^2 + \lambda_2^2}{\lambda_1^2 + \lambda_2^2}$$

where λ λ are the longer and shorter resulting natural wavelengths of the coupled system.

CRYSTAL.—A detector which uses the rectifying properties of the contact between a crystal and a metal surface, or between two crystals.

CYMOMETER.—A "wave-measurer."

DAMPING.—The diminution of energy due to the losses which always occur when it is alternating between the static and kinetic forms.

DECREMENT.—The natural logarithm of the constant ratio of the amplitudes of a damped oscillation in successive half periods.

DECREMETER.—An instrument for measuring decrement.

DETECTOR.—That portion of the receiving apparatus which enables the oscillations to operate an indicator either by controlling a local source of energy or by converting the radio frequency energy into a suitable form.

DIELECTRIC.—Any non-conductor forming part of an electric circuit.

DIELECTRIC CONSTANT.—The ratio of the capacity of a condenser with the dielectric to that of the same condenser without any dielectric.

DIFFACTION.—The deviation of the direction of propagation of a wave from the normal to the wave front at the point where the waves pass the edge of an obstruction. The amount of diffraction depends on the wavelength, and increases with increase of wavelength.

DIODE.—A two-electrode thermionic valve.

DIPLEX.—The simultaneous transmission and reception of two messages in the same direction between two stations.

DIRECTION FINDER.—A receiving instrument which, in combination with a special aerial system, enables the direction of the transmitting station to be determined.

DISCHARGER.—The piece of transmitting apparatus across the electrodes of which the spark discharge takes place.

DUPLEX.—The simultaneous transmission and reception of two messages in opposite directions between two stations.

DISPLACEMENT.—The transient current through a dielectric.

DYNATRON.—A triode which depends for its action on the liberation of electrons from the anode by electronic bombardment.

EARTH.—The connection to the earth which in most systems forms the lower extremity of the aerial system.

ELECTRODE.—The end of any metallic conductor in an electric circuit, with the exception of that in a condenser.

ELECTRON.—The natural unit of negative electricity (4.774×10^{-10} electrostatic units).

ENDODYNE.—Another name for "self heterodyne."

ETHER.—The medium assumed by the electromagnetic theory in order to explain the translation of energy at finite speed by electromagnetic waves.

FORM FACTOR.—The form factor of a symmetrical aerial for a given wavelength is the height of the centre of capacity (*i.e.*, the effective height) divided by the actual height.

FREQUENCY.—A term used in connection with any form of rhythmical motion or rhythmical change, denoting the number of complete movements or changes in a given time—usually a second.

FREQUENCY, AUDIO.—A frequency corresponding to the normally audible vibrations. These are assumed to lie below 10,000 cycles per second.

FREQUENCY, BEAT.—See Beat.

FREQUENCY, GROUP.—The frequency of definite variations in amplitude of an alternating current. The spark frequency.

FREQUENCY, RADIO.—A frequency higher than the normally audible vibrations, that is, higher than 10,000 cycles per second.

FUNDAMENTAL.—The longest stationary wave with any particular adjustment.

GRID.—The controlling electrode of a triode. It is generally in the form of a grid or mesh placed between the cathode and anode.

GROUND.—The American equivalent of "Earth."

HARD.—Applied to thermionic tubes containing an inappreciable amount of gas.

HARMONIC.—A stationary wave having a frequency which is a simple multiple of that of the fundamental, and consequently having additional nodes and antinodes.

HETERODYNE.—The production of beats by reaction between locally generated oscillations and the received oscillations.

HETERODYNE, SELF.—A receiver in which a triode acts simultaneously as a detector and as a generator of beat-producing oscillations.

HYSTERESIS.—The property of a body which causes the effect of changing conditions to lag behind those conditions, thus producing a loss.

IMPEDANCE.—The opposition to the flow of an alternating current. It is numerically equal to the square root of the sum of the squares of the resistance and the reactance of the circuit.

INDUCTANCE.—The opposition of a circuit (due to the magnetic field linked therewith) to any variation of the current flowing therein.

INTERFERENCE.—The reinforcement or neutralisation of waves arriving at a point along different paths from the same source.

IONISATION.—The liberation of electrons from the atoms of a gas, generally by collisions between the atoms and high-speed electrons.

JAR.—A capacity of a thousand centimetres.

JIGGER.—The air core transformer used to couple wireless circuits.

KALLIROTRON.—A form of aperiodic retroactive amplifier consisting of two thermionic valves so connected by pure resistances that a rise of grid potential of either produces a fall of grid potential of the other.

KATHODE.—See Cathode.

LEAK, GRID.—A high resistance connected across a condenser in series with the grid to limit the potential obtained.

LOOP.—Another name for antinode.

MAGNETIC.—A detector depending on the effect of oscillations on the hysteresis of iron.

MICROPHONE.—An instrument for magnifying sounds consisting of a resistance, usually in the form of an electrical contact, which resistance varies greatly with very small movements such as are produced by sound waves acting on a diaphragm.

NODE.—A point of zero amplitude on a stationary wave.

OSCILLATIONS.—High frequency alternations in tuned circuits.

OSCILLOGRAPH.—An apparatus for observing or recording quickly varying currents or potential differences.

PERIOD.—Any varying quantity which repeats its values regularly at equal time intervals is said to be periodic, and the time-interval of one repetition is called the periodic time or period.

PERMEABILITY.—The ratio of the magnetic flux density produced in any medium by a given magnetomotive force to that produced in a vacuum (or, for practical purposes, in air).

PHASE.—The stage or state to which a periodic variation has proceeded.

PLATE.—The anode of a thermionic tube.

PLIODYNATRON.—A combination of a pliotron and a dynatron, being a four-electrode thermionic tube. The output is controlled by the control grid which is between the filament and the heavier grid-anode.

PLIOTRON.—A very hard triode.

POLARISATION.—A wave is said to be plane polarised when its electric and magnetic displacements are confined to two fixed planes at right angles. When the plane of the electric and magnetic displacement rotates uniformly with time, the waves are said to be circularly or elliptically polarised.

POTENTIOMETER.—An instrument for adjusting at will the potential between two points.

QUENCHING.—Devices for cooling the spark gap in the primary of two closely coupled circuits, causing the spark to be extinguished as soon as the energy has passed over to the secondary circuit, and thus preventing its return.

RADIO.—American equivalent of "wireless." See also Frequency, Radio.

RADIOGRAM.—A telegram sent by wireless.

RADIOTELEPHONE.—An apparatus for the transmission of speech by wireless.

REACTANCE.—A function of the resistance inductance, capacity, and impressed frequency of a circuit. Also the American equivalent of "choke."

RECTIFIER.—An apparatus for converting alternating into continuous current, or into pulses of unidirectional current.

REFRACTION.—The change in the direction of propagation of a wave caused by a change in the medium.

RELAY.—An apparatus by means of which a current, too small to perform the required work, is made to control a larger and adequate current.

RESISTANCE.—That property of a conductor which transforms electrical energy into heat.

RESISTANCE, AERIAL.—That resistance which (other things being equal) would dissipate the same energy as the aerial radiates.

RESISTANCE, CRITICAL.—The limiting resistance beyond which the oscillatory discharge of a circuit passes into an aperiodic discharge.

RESONANCE.—The condition of being in tune.

ROOT-MEAN-SQUARE VALUE.—The R.M.S. value of an alternating current is the effective heating value.

SELECTIVITY.—The power of a receiving system to discriminate between a number of simultaneous signals.

SELF-INDUCTION.—Another name for "inductance."

SKIN EFFECT.—A high frequency current is not equally distributed through the cross-section of a conductor, but is greatest at the surface and least at the centre.

SOFT.—Applied to thermionic tubes containing an appreciable amount of gas.

SPACE CHARGE.—The electric charge of the electrons or positive ions situated in the space between the electrodes of a thermionic tube.

SPARK.—An electrical discharge across a gap.

SPECIFIC INDUCTIVE CAPACITY.—Another name for “dielectric constant.”

STATIC.—The American equivalent of “atmospherics.”

STRAYS.—Another name for “atmospherics.”

SYNCHRONOUS.—Rotating at a speed which has a fixed relation to some other speed or to the frequency of some alternating current.

SYNTONY.—The adjustment of one circuit to another, or of one transmitter taken as a whole to one receiver taken as a whole, in such a way that their time-periods are the same, and waves of a different time-period produce little or no effect on the system.

THERMIONS.—Electrons liberated from an incandescent cathode.

TICKER, TIKKER.—A rapid make-and-break device used in conjunction with a resonant circuit and a pair of telephones as a receiver for continuous waves.

TONE WHEEL.—A high speed commutator used as a receiver for continuous waves. It is run at a speed slightly different from the synchronous speed for the wave frequency, and in effect converts the high frequency current into a current of audible frequency.

TRAIN OF WAVES.—The waves produced by one discharge of the primary condenser in a spark circuit.

TRANSFORMER.—An apparatus for transferring energy from one circuit to another by magnetic induction. It may or may not alter the potential.

TRIODE.—A three-electrode thermionic tube.

TUNING.—The process of securing the maximum indication by adjusting the time period of a driven element.

UNDAMPED.—Having zero decrement.

VALVE.—A rectifier possessing unidirectional conductivity generally used as a detector.

WAVE.—A periodic variation in time and space.

WAVELENGTH.—The distance (measured in the line of propagation of the wave) between two consecutive maxima of the same sign.

WING CIRCUIT.—Another name for the anode circuit of a triode.

X's.—Another name for “atmospherics.”

(ii) FOREIGN EQUIVALENTS.

Trailing aerial	Antenne pendante (pour avion)	Coda d'aereo	Antena colgante	Freihängende Antenne
Transformer, high-frequency oscillation	Transformateur d'oscillation à haute fréquence	Transformatore delle correnti oscillatorie ad alta frequenza	Transformador de oscilaciones de alta frecuencia	Transformator fuer Hochfrequenzschwingungen
Transformer, oscillatory	Transformateur d'oscillation	Transformatore delle correnti oscillatorie	Transformador oscilatorio	Oscillationsumformer
Transmitting arrangement	Dispositif d'émission	Dispositivo di trasmissione	Dispositivo de transmisión	Senderanordnung
Transmitter, cavalry	Transmetteur pour cavalerie	Trasmittitore di stazione per cavalleria	Transmisor para estación de cavaleria	Kavalleriesendeapparat
Transmitter, inductive	Transmetteur à couplage inductif	Trasmittitore ad accoppiamento induttivo	Transmisor de inducción	Gekoppelte Sender
Transmitter, sharply tuned	Transmetteur à syntonisation aiguë	Trasmittitore acutamente sintonizzato	Transmisor de sintonización aguda	Scharf abgestimmte Sender
Transmitter, simple (P.A.)	Dispositif d'émission directe	Trasmittitore semplice	Transmisor sencillo	Einfacher Sender
Tube, ebonite	Tube en ébonite	Tubo di ebanite	Tubo de ebonita	Ebonitrohre
Tuning	Syntonisation	Sintonizzazione	Sintonización	Abstimmen
Tuning, flat	Syntonisation non aiguë	Sintonizzazione piana	Sintonización aplastada	Unscharfes Abstimmen
Tuner, multiple	Syntonisateur multiple	Sintonizzatore multiplo	Sintonizador multiple	Vielfach Abstimmaparat
Tuning, note	Hauteur de la note	Sintonizzazione della nota	Sintonización de la nota	Tonhöhe der Abstimmung
Tuning, note and wave	Note et onde de syntonisation	Sintonizzazione della nota e dell'onda	Sintonización de la nota y de la onda	Abstimmen von Tonhöhe und Welle
Tuning wave	Onde de syntonisation	Onda di Sintonizzazione	Onda de Sintonización	Abstimmungswelle
Two or three valve amplifier	Amplificateur à deux ou trois lampes	Amplificatore a due o tre valvole	Amplificador de dos ó tres valvulas	—
Undamped wave. (See Continuous wave.)				
Valve	Valve	Valvola	Válvula	Ventil
Valve, vacuum	Valve à vide	Valvola a vuoto	Valvula de vacío	Vakuumventil
Voltage	Voltage	Potenziale	Voltaje	Spannung
Voltmeter, a.c.	Voltmètre pour courant alternatif	Voltmetro per corrente alternata	Voltmetro c.a.	Voltmeter fur Wechselstrom
Voltmeter, aperiodic	Voltmètre aperiódique	Voltmetro aperiódico	Voltmetro aperiódico	Aperiodisches Voltmeter
Voltmeter, d.c.	Voltmètre pour courant continu	Voltmetro per corrente continua	Voltmetro c.c.	Voltmeter fuer Gleichstrom
Voltmeter, hot-wire	Voltmètre à fil chaud	Voltmetro a filo caldo	Voltmetro térmico	Heizdrahtvoltmeter
Voltmeter, switch	Interrupteur de volt-mètre	Interruttore per voltmetro	Voltmetro, interruptor para	Voltmeterumschalter
Wave frequency	Fréquence des ondes	Frequenza dell'onda	Frecuencia de onda	Wellen frequenz
Wavelength	Longueur d'onde	Lunghezza d'onda	Longitud de onda	Wellenlaenge
Wavemeter	Ondamètre	Ondametro	Onómetro	Wellenmesser
Waves, radiation of	Radiation des ondes	Irraggiamento di onde	Radiación de las ondas	Ausstrahlung der Wellen

GENERAL INFORMATION AND USEFUL TABLES

INTERNATIONAL RULES FOR THE USE OF SYMBOLS*

* Extracted from the report of the International Electrotechnical Commission.

(a) Instantaneous values of electrical quantities which vary with the time to be represented by small letters. In case of ambiguity they may be followed by the subscript "t."

(b) Virtual or constant values of electrical quantities to be represented by capital letters.

(c) Maximum values of periodic electrical and magnetic quantities to be represented by capital letters followed by the subscript "m."

(d) In cases where it is desirable to distinguish between magnetic and electric quantities, constant or variable, magnetic quantities to be represented by capital letters of either script, heavy-faced or any special type. Script letters to be only employed for magnetic quantities.

(e) Angles to be represented by small Greek letters.

(f) Dimensions and special quantities to be represented, wherever possible, by small Greek letters.

I.—QUANTITIES.

Name of Quantity.	Symbol.	Name of Quantity.	Symbol.
Length	<i>l</i>	Resistance	<i>R</i>
Mass	<i>m</i>	Resistivity	<i>ρ</i>
Time	<i>t</i>	Conductance	<i>G</i>
Angles	<i>α, β, γ...</i>	Quantity of electricity	<i>Q</i>
Acceleration of gravity	<i>g</i>	Flux-density, electrostatic	<i>D</i>
Work	<i>A</i>	Capacity	<i>C</i>
Energy	<i>W</i>	Dielectric constant	<i>ε</i>
Power	<i>P</i>	Self-inductance	<i>L</i>
Efficiency	<i>η</i>	Mutual inductance	<i>M</i>
Number of turns in unit of time	<i>n</i>	Reactance	<i>X</i>
Temperature Centigrade	<i>t</i>	Impedance	<i>Z</i>
Temperature absolute	<i>T</i>	Reluctance	<i>S</i>
Period	<i>T</i>	Magnetic flux	<i>Φ</i>
$2\pi/T$	<i>ω</i>	Flux-density, magnetic	<i>B</i>
Frequency	<i>f</i>	Magnetic field	<i>H</i>
Phase displacement	<i>φ</i>	Intensity of Magnetisation	<i>J</i>
Electromotive force	<i>E</i>	Permeability	<i>μ</i>
Current	<i>I</i>	Susceptibility	<i>κ</i>

II.—UNITS. SIGNS FOR NAMES OF UNITS.

Signs for names of Electrical Units to be employed only after numerical values :—

Name of Unit.	Sign.	Name of Unit.	Sign.
Ampere	<i>A</i>	Volt-coulomb	<i>VC</i>
Volt	<i>V</i>	Watt-hour	<i>Wh</i>
Ohm	<i>Ω</i>	Volt-ampere	<i>VA</i>
Coulomb	<i>C</i>	Ampere-hour	<i>Ah</i>
Joule	<i>J</i>	Milliampere	<i>mA</i>
Watt	<i>W</i>	Kilowatt	<i>kW</i>
Farad	<i>F</i>	Kilovolt-ampere	<i>kVA</i>
Henry	<i>H</i>	Kilowatt-hour	<i>kWh</i>

m—Sign for milli- μ—Sign for micro- or micr- k—Sign for kilo- M—Sign for mega- or meg.

* As a sign for the ohm, one of the two letters *O* or *Ω* is recommended. The letter *Ω* should no longer be used for megohm.

III—MATHEMATICAL SYMBOLS AND RULES.

Name.	Symbol.	Name.	Symbol.
Total differential	d	Ratio of circumference to diameter	π
Partial differential	δ	Summation	Σ
Base of Napierian logarithms	e	Summation, integral	\int
Imaginary $\sqrt{-1}$	i		

Ordinary numerals as exponentials shall exclusively be used to represent powers. (In consequence, it is desirable that the expression $\sin^{-1}x$, $\tan^{-1}x$, employed in certain countries be expressed by $\arcsin x$, $\arctan x$.)

The comma and the full-stop shall be employed for separating the decimals according to the custom of the country, but the separation between any three digits constituting a whole number shall be indicated by a space and not by a full-stop or a comma (1 000 000).

For the multiplication of numbers and geometric quantities, indicated by two letters, it is recommended to use the sign \times , and the full-stop only when there is no possible ambiguity.

To indicate division in a formula, it is recommended that the horizontal bar or the colon be employed. Nevertheless the oblique line may be used when there is no possibility of ambiguity; when necessary, ordinary brackets $()$, square brackets $[\]$, and braces $\{ \}$, may be employed to obtain clearness.

IV—ABBREVIATIONS FOR WEIGHTS AND MEASURES.

Length:—m; km; dm; cm; mm; μ =0.001 mm. Surface:—a; ha; m²; km²; dm²; cm²; mm². Volume:—l; hl; dl; cl; ml; m³; km³; dm³; cm³; mm³. Mass:—g; t; kg; dg; cg; mg.

V—NAME FOR ELECTRICAL UNIT.

The name "Siemens" has been recommended for the unit of conductance.

SYMBOLS FOR MULTIPLES AND SUB-MULTIPLES.

Multiple or Sub-Multiple.	Name	Symbol.	Multiple or Sub-Multiple.	Name	Symbol.
10 ⁶	Mega	M	10 ⁻⁶	Micro	μ
10 ³	Kilo-	k	10 ⁻⁹	Millimicro-	m μ
10 ⁻³	Milli-	m	10 ⁻¹²	Pico	p or $\mu\mu$

The old usage of $\mu\mu$ as an abbreviation for 10⁻⁹ metre is undesirable. The prefix Billi- is sometimes used instead of Millimicro-.

THE "MILE" EQUIVALENTS OF VARIOUS NATIONS.

	English Yards.		English Yards.
Arabian mile	2,148	German mile, short	6,859
Bohemian mile	10,137	Hamburg mile	8,244

1 gallon in wine, ale, or dry measure

= 277 $\frac{1}{2}$ cubic inches = 0.16 cubic foot

= 10 lb. of distilled water =

Cube feet \times 6.2355 = gallons.

Cube ins. \times 0.003607 = gallons.

1 bushel = 2218.19 cube inches = 1.28 cube foot.

Cube feet = 0.78 = bushels.

Cube ins. \times 0.00045 = bushels.

SQUARE OR SURFACE MEASURE.

144 square inches = 1 square foot.

9 square feet = 1 square yard.

30 $\frac{1}{2}$ square yards = 1 square rod or perch.

40 square rods = 1 rood.

4 roods = 1 acre (4,840 square yards).

640 acres = 1 square mile (3,097,600 square yards).

METRIC SYSTEM OF WEIGHTS AND MEASURES.

The Metric System is based upon the estimated length of the fourth part of a terrestrial meridian. The ten-millionth part of this arc is called a *Metre*, and is the unit of length. The cube of the tenth part of a metre was adopted as the unit of capacity, and denominated a *Litre*. The weight of a litre of distilled water at its greatest density was called a *Kilogramme*, of which the thousandth part, or *Gramme*, was adopted as the unit of weight. The multiples of these, proceeding in decimal progression, are distinguished by the employment of the prefixes *deca*, *hecto*, *kilo*, and *myria*, and the subdivision by *deci*, *centi*, and *milli*. The units in general use are as follows:—

MEASURES OF LENGTH (UNIT METRE).

Equal to	Metre.	Inches.	Feet.	Yards.	Mill.
Millimetre	0.001	0.039	0.003	0.001	0.00
Centimetre	0.010	0.393	0.032	0.010	0.000
Metre	1.000	39.370	3.280	1.093	0.000
Kilometre	1000.000	39370.790	3280.899	1093.633	0.62

CUBIC, OR MEASURES OF CAPACITY (UNIT LITRE).

Equal to	Cubic inches.	Cubic feet.	Pints.	Gallons.
Cubic Centimetre	10.061	0.000	0.001	0.000
Litre, or cubic decimetre	61.027	0.035	1.760	0.220
Cubic Metre	61027.051	35.316	1760.773	220.096

MEASURES OF WEIGHT (UNIT GRAMME).

Equal to	Grains.	Avoirdupois lb.	Cwt. = 112 lb.	Tons = 20 cwt.
Milligramme	0.015	0.000	0.000	0.0000
Gramme	15.432	0.002	0.000	0.0000
Kilogramme	15432.348	2.204	0.019	0.0009
Tonne = 1,000 kilogs.	—	2204.000	19,678	0.9839

SQUARE OR SURFACE MEASURE.

Equal to	Square feet.	Square yards.
Square Metre	10.7643	1.196
Hectare = 10,000 sq. met. = 11,960 sq. yds. = 2.47 acres.		

The Metric System of Weights and Measures, which, as plainly demonstrated in the preceding pages, is logically symmetrical, now forms the usual standard in the following countries :—

* Argentine Republic.	Egypt.	* Peru.
Austria-Hungary.	France.	Portugal.
Belgium.	German Empire.	† Roumania.
* Bolivia.	† Greece.	Servia.
* Brazil.	Holland.	* Spain.
* Chile.	Italy.	Sweden.
* Colombia.	* Mexico.	
Denmark.	Norway.	

The following countries have not adopted the Metric System :—

CANADA.—The legal Weight and Measures are the Imperial Yard, Imperial pound avoirdupois, Imperial gallon, and the Imperial bushel. By Act 42 Vict., Cap. 16, the British hundredweight of 112 pounds and the ton of 2,240 pounds were abolished, and the hundredweight was declared to be 100 pounds, and the ton 2,000 pounds avoirdupois as in United States, but sometimes contracts stipulate for the British weights.

CHINA.—

Weights— 10 Ch'ien = 1	Liang (Tael) = 1.333 oz. avoirdupois or 37.78 grammes
16 Liang = 1	Kin (Catty) = 1.333 lb. avoirdupois or 604.53 grammes
100 Chin = 1	Tan (Picul) = 133.333 lb. avoirdupois or 60.453 kilogrammes
4 ozs. = 3 taels ; 1 lb. = $\frac{3}{4}$ catty or 12 taels ; 1 cwt. = 84 catties ; 1 ton = 16 piculs 80 catties	

Capacity—10 Ko	= 1 Sheng (pint) = 1.031 litre.
10 Sheng	= 1 Tou (peck) = 10.31 litre (holding from 6½ to 10 Kin of rice and measuring from 1.13 to 1.63 gallon)

Commodities, even liquids, such as oil, spirits, etc., are commonly bought and sold by weight.

* Old Spanish measures also occasionally used are :—

Onza	= 1.014 ounce avoirdupois.
Libra	= 1.014 lb. avoirdupois.
Quintal	= 101.44 lb. avoirdupois.
Arroba (of 25 libras)	= 25.36 lb. avoirdupois.
Arroba of Wine	= 6.70 Imperial gallons.
Gallon	= 0.74 Imperial gallon.
Vara	= 0.927 yard.
Square Vara	= 0.859 square yard.

† Turkish measures are also in use :—

Oke of 410 drams	= 2.8283 lb. avoirdupois
Almud	= 1.151 Imperial galls.
Kileh	= 0.9120 Imperial gallon
44 okes = 1 Cantar	= 124.3616 lb. avoirdupois
39.6263 okes	= 1 cwt.
130 okes = 1 Tcheke	= 509.095 pounds.
1 kileh = 20 okes	= 0.36 Imperial qtr.
816 kilehs	= 100 Imperial qtrs.

Length—10 Fen	= 1 T'sun (inch)
10 T'sun	= 1 Chi'h (foot) = 14.1 English inches by treaty
10 Chi'h	= 1 Chang = 11 ft. 9 in. (141 in. by treaty)
1 Li	= $\frac{1}{2}$ English mile (about)

The mow, the unit of measurement, is almost exactly one-sixth of an acre. In the tariff settled by treaty between Great Britain and China, the Chi'h of 14 $\frac{1}{10}$ English inches has been adopted as the legal standard. The standards of weight and length vary all over the Empire, the Chi'h ranging from 9 to 16 English inches, and the Chang (= 10 Chi'h) in proportion; at the treaty ports, the use of foreign treaty standard of Chi'h and Chang is common.

In October, 1907, a decree for uniform weights and measures was issued, making the K'up'ing or Treasury Scale the standard weight. The K'up'ing tael or ounce weighs 575.64 grains. The Haikwan tael weighs 581.47 grains.

INDIA.—The Maund of Bengal.

40 Seers	= 82 $\frac{1}{2}$ lb. avoirdupois
The Maund of Madras ..	= 25 lb. avoirdupois (nearly)
The Tola	= 180 grains troy
The Guz of Bengal ..	= 36 inches

An Act to provide for the adoption of a uniform system of weights and measures was passed in 1871. The Act orders: "Art. 2. The primary standard of weight shall be called a seer, and shall be a weight of metal in the possession of the Government of India, equal, when weighed in a vacuum, to the weight known in France as the kilogramme = 2.205 lb. avoirdupois." "Art. 3. The Units of weight and measures of capacity shall be, for weights, the said seer; for measures of capacity, a measure containing one such seer of water at its maximum density, weighed in a vacuum. Unless it be otherwise ordered, the subdivisions of all such weights and measures of capacity shall be expressed in decimal parts." This Act, however, has never been in operation.

JAPAN—

The Mommé	= 2.11 drams or 2.41 dwts. or 120 mommé = 1 lb. avoirdupois
The Kin (Catty) = 160 mommé	= 1.322 lb. avoirdupois (0.266 mommé = 1 gramme) or 1.60 lb. troy
The Picul (100 kin)	= 132.27 lb.
The Kwan = 1,000 mommé ..	= 8.261 lb. avoirdupois or 10.04 lb. troy
The Shaku	= 0.994 foot (3.3 shaku = 1 metre)
The Kujira Shaku	= 1.242 feet
The Sun	= 1.193 inches
The Ken = 6 Shaku	= 5.965 feet
The Jo = 10 Shaku	= 9.942 feet
The Chô = 60 Ken	= 357.916 feet, or about $\frac{1}{3}$ mile
The Ri = 36 Chô	= 2.44 miles
The Ri (marine)	= 1.15 mile
The Ri (square)	= 5.9552 square miles
The Chô = 10 tan	= 2.45 acres
The Koku, Liquid = 10 To = 100 Sho	= 39.7033 gallons
The Koku, Dry	= 4.9629 bushels
The Koku (capacity of vessel)	= $\frac{1}{10}$ ton
The To, Liquid	= 3.9703 gallons
The To, Dry	= 1.9851 peck

RUSSIA.—

1 Verst (500 sajènes)	= 3,500 feet, or two-thirds of a statute mile
1 Sajène (3 arshins)	= 7 feet
1 Arshin (16 vershok)	= 28 inches
1 Square Verst	= 0.43941 square mile
1 Dessiatine	= 2.69972 acres
1 Pound (96 zolotniks = 32 lot)	= $\frac{9}{16}$ of a pound or 14.4 ounces
1 Pood (40 pounds)	= 36.113 lb. = 0.32244 cwt. or 100 poods = 1.6121 tons. Baltic Freight is usually quoted per ton of 62 poods
1 Vedro (8 shtoffs)	= 2 $\frac{1}{4}$ Imperial gallons
1 Chetvert (8 chetveriks)	= 5.77 Imperial bushels or 46.2 gals.

UNITED STATES.—

British weights and measures are usually employed, but the old Winchester gallon and bushel are used instead of the new or Imperial standards. Different States have a legal standard for bushels of certain articles, such as grain and potatoes, varying from 60 lb. for wheat to 32 for oats.

Wine gallon	= 0.83333 gallon
Ale gallon	= 1.01695 gallon
Bushel	= 0.9692 Imperial bushel
Instead of the British cwt. a central of 100 lb. is used. 1 ton = 2,000 lb., except coal, which is usually 2,240 lb. wholesale.		

NAUTICAL MEASURES

(From "Lloyd's Calendar," by permission of the Committee of Lloyd's.)

12 inches	= 1 foot	6 feet	= 1 fathom
3 feet	= 1 yard	3 nautical miles	= 1 league

Sea or Nautical Mile—one-sixtieth of a degree of latitude, and varies from 6,046 ft. on the Equator to 6,092 ft. in lat. 60°

Nautical Mile for speed trials, generally called the Admiralty Measured Mile	{	6,080 feet
		1.151 statute miles
		1,853 metres

Cable's length= the tenth of a nautical mile; or, approximately, 100 fathoms or 200 yards.

A Knot—a nautical mile an hour, is a measure of speed, but is not infrequently, though erroneously, used as synonymous with a nautical mile.

Length of European Measures of Distances compared with the Nautical Mile of 6,080 ft.

	Length in Nautical Miles.		Length in Nautical Miles.
Nautical Mile	1.000	German Ruthen	4.064
British Statute Land Mile	0.868	Italian Mile	1.000
Austrian Mile	4.094	Norwegian Mile	6.097
Danish Mile	4.064	Russian Verst	0.576
French Kilometre	0.539	Swedish Mile	5.769
German Geographical Mile	4.000		

DISTANCE OF HORIZON AT SEA.

Let h be the height of the observer's eye above sea level, D the distance to the horizon, and R the earth's radius.

Then

$$D^2 = 2Rh$$

And thus D in statute miles $= 1.22 \sqrt{h}$ in feet

D in kilometres $= 2.52 \sqrt{h}$ in metres

An object of height h^1 is seen by an eye at height h at a distance D^1 given by

D^1 in statute miles $= 1.22 \sqrt{h}$ in feet $+ \sqrt{h^1}$ in feet

D^1 in kilometres $= 2.52 \sqrt{h}$ in metres $+ \sqrt{h^1}$ in metres

The distance of the horizon—i.e., the greatest distance at which the surface of the sea is visible—varies somewhat with refraction in the atmosphere.

METHOD OF DENOTING THE TRUE BEARING AND COURSE OF A SHIP AT SEA

As regards the true bearing of the ship from the coast station, the degrees are reckoned "clockwise" from north round through east, south, and west

Thus, if the ship's *bearing* from the coast station is anything between north and east, the number to be signalled will be between 0 and 90.

Between east and south the number will be between 90 and 180.

Between south and west the number will be between 180 and 270.

Between west and north the number will be between 270 and 360.

Similarly, if the ship's *course* is between N. and E. the number to be signalled will be between 0 and 90.

Between E. and S. the number to be signalled will be between 90 and 180.

Between S. and W. the number to be signalled will be between 180 and 270.

Between W. and N. the number to be signalled will be between 270 and 360.

To facilitate the conversion of the bearing and course into the number of degrees to be signalled, a table is appended in which either the bearing of the ship from the coast station, or the bearing of the coast station from the ship can be ascertained and the number of degrees to be signalled seen at a glance. The course must be looked for in the same column as the bearing of the ship from the coast station.

Thus a ship 150 miles bearing S 75° W. from a coast station and steaming S. 85° E. at 15 knots, and having telegrams comprising 75 words to send, on receiving the signal to Go (— • —) from the coast station, would signal the following:—

— • — • — XYZ — • • • ABC — 150 255
 95 15 75 • — • — • (end).

MEASURES OF TIME

The earth's axial rotation is the phenomenon by which time is measured everywhere on the earth's surface. Experiment and observation show that if we assume the earth to rotate uniformly, there are many other phenomena which are as accurately isochronous in their periodicity. That is to say, they pass again and again through all their phases in exactly the same interval of time as measured in terms of the earth's rotation. In the pendulum of a clock and the balance wheel of a watch we have such isochronism very approximately realised. A little consideration will convince us that the measurement of time is really a comparison of periodic sequences. We cannot conceive any other mode of marking off time intervals than by some kind of motion of a periodic character. Our practical unit of time is essentially terrestrial.

SIDEREAL DAY.—The standard unit of time is the **SIDEREAL DAY**, being the period in which the earth turns once round on its axis. It is divided into sidereal hours, minutes, and seconds.

MEAN SOLAR TIME.—A **SECOND** is the time of one swing of a pendulum adjusted so as to make 86,164·09 swings in a sidereal day. Seconds are usually subdivided decimally.

One **MEAN SOLAR DAY** = 24 hours = 1,440 minutes = 86,400 seconds = 1·00273791 sidereal day.

RELATION BETWEEN TIME AND LONGITUDE.—At any given instant the mean solar time at two stations differ by an amount proportional to their difference of longitude, the time at the eastern station being the earlier.

CORRESPONDING DIFFERENCES.			
Longitude.	Time.	Longitude.	Time.
15"	1 second.	75°	5 hours.
1'	4 seconds.	90	6 "
15'	1 minute.	105	7 "
1°	4 minutes.	120	8 "
15°	1 hour.	135	9 "
30	2 hours.	150	10 "
45	3 "	165	11 "
60	4 "	180	12 "

To show the exact date of any event, the meridian at which the time is reckoned must be specified. One degree longitude at Equator=60 nauts. 69.17 statute miles.

STANDARD OR ZONE TIME.

BELL TIME ON BOARD SHIP.

The nautical day begins at noon and is divided into "watches" of four hours each, time being indicated by bells striking every half-hour.

A.M.	A.M.	A.M.		P.M.	P.M.	P.M.
12.30	4.30	8.30....1	BELL....	12.30	4.30	8.30
1.00	5.00	9.00....2	BELLS....	1.00	5.00	9.00
1.30	5.30	9.30....3	BELLS....	1.30	5.30	9.30
2.00	6.00	10.00....4	BELLS....	2.00	6.00	10.00
2.30	6.30	10.30....5	BELLS....	2.30	6.30	10.30
3.00	7.00	11.00....6	BELLS....	3.00	7.00	11.00
3.30	7.30	11.30....7	BELLS....	3.30	7.30	11.30
4.00	8.00	NOON....8	BELLS....	4.00	8.00	MIDNIGHT.

* Greenwich time is used in France, Spain, Portugal, Belgium, Gibraltar, and the Faroes.

One of these four-hour watches is divided into two "dog watches":—

(1) From 4 to 6 p.m.

(2) From 6 to 8 p.m.

The hours for the "dog watches" are:—

4 BELLS.....	6.00 p.m.
1 BELL	6.30 p.m.
2 BELLS.....	7.00 p.m.
3 BELLS.....	7.30 p.m.

INDUCTANCE OF SINGLE LAYER COILS

$$L = \pi d^2 n^2 l k$$

l = Inductance in cms.

d = Diameter of coil.

n = Number of turns per cm.

k = Factor which depends on the ratio of the diameter to the length of the coil.

If the total number of turns of wire are used instead of the number of turns per cm. the formula may be written

$$L = \frac{\pi^2 d^2 n^2 K}{I.}$$

Where N is the total number of turns.

The total length of wire in the coil is πdn , so that a third form is

$$L = \frac{x^2}{I.} K.$$

Where $x = \pi dn$.

The values of k , for the ratio of length to diameter of the coil between 0.01 and 10 have been calculated by Prof. Nagaoka. The values are given in the table:

INDUCTANCE AND CAPACITY. TABLE I.

For making approximate calculations of the inductance of a coil, Table 2 has been worked out. This table gives the inductance of coils of diameters ranging from 4 to 18 cms. in diameter, and from 1 to 34 cms. long.

The inductance given is for a winding of 10 turns per centimetre. For other windings the values given in the table should be multiplied by $\frac{N^2}{100}$ where N is the number of turns per centimetre.

In Table 3 are given the number of turns per centimetre for coils wound with various covered wires. These figures have been worked out from the diameters given in the catalogue of a leading wire manufacturer, and in many cases checked on actual coils. They must, however, be regarded as approximate only, since the number of turns per centimetre depends on the skill of the winder and the overall dimensions of the covered wire, which is not absolutely constant.

Subject to these limitations the table will be found to give very good results for approximate work.

INDUCTANCE OF A COIL WOUND WITH 10 TURNS PER CENTIMETRE.

DIAMETER IN CENTIMETRES.

Length in cms.	4	5	6	7	8	9

Columns 4 and 7 give the ratio of inductance of a coil wound with the given wire to that of a similar coil wound with 20 turns per centimetre (Table 2).

The resistances in columns 5 and 8 are for a length of 1 centimetre winding on a coil of 10 cms. diameter.

Enamelled wire has approximately the same dimensions as single silk covered in the smaller gauges.

COIL OF MAXIMUM INDUCTANCE.

In winding an inductance it is desirable in most cases to make its resistance as small as possible, since in this case the length of wire will also be a minimum. It is not possible to give a single formula for winding the dimensions of a coil with maximum inductance in every case, since the value of the inductance depends on the correction terms for thickness of insulation, etc. The original formula given by Maxwell is that if the section of the coil is square the maximum inductance is obtained when the mean diameter of the coil is 3.7 times the side of the square.

In a recent article Messrs. Shawcross & Wells have given curves of the inductance obtained for a wire 1 mm. in diameter and 1570.8 (500 π) metres long, coiled up in different forms. The coil of maximum inductance for a square section coil is that from the curves with diameter about three times the side of the square.

The square section coil has a greater inductance than coils of other ratios of width b to depth c .

Thus the inductance for the square section coil is 1.29 henrys (approx.).

For a ratio $\frac{b}{c} = 2$ the maximum inductance is 1.24 henrys and is for a ratio $\frac{d}{b}$ about 2.3.

For $\frac{b}{c} = 5$ max. inductance = 1.07 henrys; for $\frac{d}{b} = 1.5$.

Dr. A. Russell has pointed out that for maximum possible inductance from a given length of wire the section of the coil should be circular, and with a ratio $a = 2.575r$, where a is the radius of the circular axis of the coil, and r is the radius of the cross-section.

The inductance is

$$L = 5.35\pi N^2 a \times 10^{-9} \text{ henrys.}$$

where N = total number of turns.

For a single-layer coil for the case where the turns are close-wound the coil of maximum inductance is given by $\frac{\text{diameter}}{\text{breadth}} = 2.415$.

This can be seen by plotting a curve of the inductance as calculated by Nagaoka's formula.

When the coil is wound with spaced windings the inductance will depend on the spacing, and therefore it must be worked out for any particular case from the formulas given.

INDUCTANCE OF COILS WITH IRON CORES.

The formulas for inductance given in the previous formulas have been for coils without magnetic cores.

The inductance of these coils depends principally on the geometrical dimensions, with a small correction factor depending on the frequency of the current, so that there are formulas available for every possible case, many being of the highest accuracy.

For coils with iron cores, however, the inductance depends on the physical properties of the core as well as the dimensions of the coil, and these properties are variable. The flux density B , which is induced in a sample of iron by a magnetising force H , is given by relationship

$$B = \mu H$$

where μ is the permeability.

Now, μ is not a constant for any one sample, but varies in a complex manner with H and also varies within wide limits for different samples of iron.

The inductance of an iron core coil, therefore, depends on the permeability of the iron, and this varies over the cross-section of the core, since H is not constant over the area. Moreover, if the current in the coil (by which H is produced) varies, the value of μ will change.

It is, therefore, only possible to select some average value for μ which can be taken by experience to give a representative value for the particular coil in question.

Where the coil is in such a form that the iron forms are nearly closed circuit with a relatively small air gap, a convenient formula is

$$L \text{ (henrys)} = \frac{0.4N^2\mu A}{l}$$

in which μ is the permeability of the air gap ($\mu = 1$). l is the length of the air gap in centimetres, A is the cross-section normal to the flux at the gap (the area of the surface of the iron core at the air gap), N is the total number of turns on the coil.

For an open-core coil a similar formula which may be used is

$$L = \frac{N^2 A \mu}{l} k$$

where N = total number of turns, l = length of the iron core, A = cross-section of the core μ = the permeability of the value of H at the centre of the core, and k is a factor to be determined by experiment or from previous data to allow for the effect of the ends. The area A is strictly of that of the iron in the core after allowing for air spaces or insulation between the strips or wires of which the iron is composed, but if the same iron be used for various coils, the outside area of the core is taken from the difference allowed for in k .

CALCULATION OF CAPACITY.

The capacities given by the following formulas are in microfarads. The farad is 10^{-9} of the cgs. electromagnetic unit and is defined as the capacity of a condenser charged to a potential of 1 volt by 1 coulomb of electricity. In the formulas here given all lengths are expressed in centimetres and all areas in square centimetres.

PARALLEL PLATE CONDENSER.

Let S = surface area of one plate.

r = thickness of the dielectric.

K = dielectric constant ($K = 1$ for air).

$$C = 0.0885 K \frac{S}{r} \text{ microfarads.}$$

If, instead of a single pair of metal plates, there are N similar plates the dielectric between, alternate plates being connected in parallel,

$$C = 0.0885 K \frac{(N-1) S}{r}$$

In these formulas no allowance is made for the curving of the lines of force at the edges of the plates; the effect is negligible where r is very small compared with S .

VARIABLE CONDENSER WITH SEMI-CIRCULAR PLATES.

Let N = total number of parallel plates.

r_1 = outside radius of the plates.

r_2 = inner radius of plates.

r = thickness of dielectric

K = dielectric constant.

Then, for the position of maximum capacity (movable plates between fixed plates).

$$C = 0.1390 K \frac{(N-1) (r_1^2 - r_2^2)}{r}$$

This formula does not take into account the effect of the edges of the plates, but as the capacity is also affected by the containing case it will not generally be worth while to take the edge effect into account.

WAVELENGTH AND FREQUENCY OF RESONANCE.

$$\lambda_{cm} = 1.8838 \times 10^{11} \sqrt{LC} \text{ (cgs. electromagnetic units).}$$

$$= 6.283 \sqrt{L \text{ cgs. electromagnetic } C \text{ cgs. electrostatic.}}$$

$$\lambda_m = 0.05957 \sqrt{L \text{ cgs. electromagnetic } C \text{ micromicrofarad.}}$$

$$= 1.884 \sqrt{L \text{ microhenry } C \text{ micromicrofarad.}}$$

$$= 1884 \sqrt{L \text{ microhenry } C \text{ microfarad.}}$$

$$= 59570 \sqrt{L \text{ millihenry } C \text{ microfarad.}}$$

$$= 1884000 \sqrt{L \text{ henry } C \text{ microfarad.}}$$

$$f = \frac{159.2}{\sqrt{L \text{ henry } C \text{ microfarad.}}}$$

$$= \frac{5033}{\sqrt{L \text{ millihenry } C \text{ microfarad.}}}$$

$$= \frac{159200}{\sqrt{L \text{ microhenry } C \text{ microfarad.}}}$$

$$\omega = \frac{1000}{\sqrt{L \text{ henry } C \text{ microfarad.}}}$$

$$= \frac{31620}{\sqrt{L \text{ millihenry } C \text{ microfarad.}}}$$

$$= \frac{1,000,000}{\sqrt{L \text{ microhenry } C \text{ microfarad.}}}$$

$$T = \frac{1}{f} = \frac{2\pi}{\omega}$$

$$\lambda_m = \frac{2.998 \times 10^8}{f}$$

$$= \frac{1.884 \times 10^9}{\omega}$$

A.C. IN RESISTANCE, INDUCTANCE AND CAPACITY.

A sine voltage $E \sin \omega t$ produces a current

$$i = \frac{E}{R} \sin \omega t \text{ in a resistance } R$$

$$i = \frac{E}{L\omega} \sin \left(\omega t - \frac{\pi}{2} \right) \text{ in an inductance } L$$

$$i = \frac{E}{1/(C\omega)} \sin \left(\omega t + \frac{\pi}{2} \right) \text{ in a capacity } C$$

the units being a consistent system.

The quantities $L\omega$ and $-1/C\omega$ are called the "Reactance." or sometimes $1/(C\omega)$ is called capacity reactance. The symbol for reactance is X . If a circuit possesses a resistance, an inductance and a capacity acting in series, we have

$$i = \frac{E}{\sqrt{R^2 (L\omega - 1/C\omega)^2}} \sin \left(\omega t - \angle \frac{L\omega - 1/C\omega}{R} \right)$$

The denomination is called the "impedance" of the circuit. Its symbol is Z . Here the reactance $X = L\omega - 1/(C\omega)$, and may be positive or negative.

The current is $i = \frac{E}{Z} \sin \left(\omega t - \angle \frac{X}{R} \right)$

In effective values $A = \frac{V}{Z}$, with lag $\angle \frac{X}{R}$

In the general case with voltage e as given above.

$$\begin{aligned} i = i_0 + \frac{E_1}{Z_1} \sin \left(\omega t + \psi_1 - \angle \frac{X_1}{R} \right) \\ + \frac{E_2}{Z_2} \sin \left(2\omega t + \psi_2 - \angle \frac{X_2}{R} \right) \\ + \frac{E_3}{Z_3} \sin \left(3\omega t + \psi_3 - \angle \frac{X_3}{R} \right) \end{aligned}$$

Where $Z_2 = \frac{+ \text{etc.}}{\sqrt{R^2 + X_2^2}},$

$$X_2 = 2\omega L - 1/2\omega C, \text{ etc.}$$

IMPEDANCES IN SERIES AND PARALLEL.

Let two circuits with impedances Z, Z' be connected in series. The total resistance is $R + R'$, the total reactance is $X + X'$. The latter is an algebraic sum. The total impedance is therefore

$$\sqrt{(R + R')^2 + (X + X')^2}, \text{ with lag } \frac{X + X'}{R + R'}$$

Let the two circuits be connected in parallel. The total impedance is $ZZ' \div \sqrt{(R + R')^2 + (X + X')^2}$

with lag $\angle \frac{X}{R} + \angle \frac{X}{R'} - \angle \frac{X + X'}{R + R'}$

Just as problems on resistances in parallel can be more easily handled by using conductances instead of resistances, so problems on impedances in parallel may be worked by using "admittances," the reciprocals of impedances.

CLOCK DIAGRAMS.

Sine currents and voltages can be represented in a plane by the projection on an axis of vectors whose lengths and directions are chosen to represent magnitudes and phases. If the vectors be supposed to rotate, relatively to the axis, with angular velocity ω , the projections represent the alternating values. These vector figures afford great help in solving such A.C. problems as permit the vectors to lie in one plane. They are called clock diagrams and are usually drawn to represent voltages.

Suppose A.C. of maximum value I to flow in a circuit comprising resistance R , inductance L , capacity C , in series. Set off at any angle, ωt , the vector OF to represent RI to scale. At right angles, and forward, set off FG to denote $L\omega I$ to the same scale. From the end G set off $-I/C\omega$ in the same direction. In effect this subtracts from $L\omega I$, so that FH represents $(L\omega - I/C\omega) I$, or XI , where X is the whole reactance. Join OH . By geometry,

$$OH = \sqrt{R^2 + X^2} \times I = ZI$$

where Z is the impedance of the circuit.

The projections on the upright axis give instantaneous voltages. Thus Of is the instantaneous voltage across the resistance, fg that across the inductance, gh that across the capacity (down means minus), and fh that across the whole reactance, and Oh that at the terminals of the circuit. Thus Oh represents $E \sin \omega t$ to scale. The relative phases of the voltage and current are seen in the relative directions of the vectors OH and OF . The current lags behind the applied E.M.F. by $\angle HF/OF$ — i.e., $\angle X/R$.

By altering the scale in the ratio $\sqrt{2}$ the vectors give directly the effective, instead of the maximum, values of voltage and current.

Sulphur dioxide at about 760 mm. pressure	1.0093
Vacuum	0.9994

MATHEMATICAL CONSTANTS AND FORMULÆ.

Ratio of circumference to diameter of circle $\pi = 3.1416$

$$\frac{\pi}{2} = 1.5708 \qquad \frac{4}{3}\pi = 4.1888 \qquad \frac{1}{\pi} = 0.3183$$

$$\frac{\pi}{4} = 0.7854 \qquad \pi^2 = 9.870 \qquad \sqrt{\pi} = 1.772$$

$$4\pi = 12.566 \qquad \pi^3 = 31.01 \qquad \sqrt{\pi} = 1.465$$

ANGLES.

$$1 \text{ degree} = \frac{\pi}{180} \text{ radian} = 0.01745 \text{ radian.}$$

$$1 \text{ radian} = \frac{180}{\pi} \text{ degrees} = 57^\circ 0.2958$$

$$= 57^\circ 17' 14'' = 206,265 \text{ seconds.}$$

LOGARITHMS.

Base of natural logarithms $e = 2.71828$, $1/e = 0.3679$, $e^2 = 7.3890$.

To convert—

natural logarithms to common, multiply by $\log_{10} e = 0.43429$ common logarithms to natural, multiply by 2.3026 .

VARIOUS FORMULÆ:—

$$\text{Binomial } (1+x)^n = 1 + nx + \frac{n(n-1)}{1 \times 2} x^2 + \frac{n(n-1) \times (n-2)}{1 \times 2 \times 3} x^3 + \dots$$

for $x < 1$ numerically.

$$\text{Logarithmic } \log_e (1-x) = - \left(x + \frac{x^2}{2} + \frac{x^3}{3} + \dots \right)$$

for $x < 1$ numerically.

$$\text{Exponential } e^x = 1 + x + \frac{x^2}{1 \times 2} + \frac{x^3}{1 \times 2 \times 3} + \dots \text{ for all values of } x$$

$$\exp x = e^x$$

$$a = \exp (x \log_e a)$$

$$\frac{1}{2} (e^x + e^{-x}) = \cosh x,$$

$$\frac{1}{2} (e^x - e^{-x}) = \sinh x$$

$$\frac{1}{2} (e^{i\theta} + e^{-i\theta}) = \cos \theta,$$

$$\frac{1}{2} (e^{i\theta} - e^{-i\theta}) = i \sin \theta$$

$$\therefore \cosh i\theta = \cos \theta$$

$$\sinh i\theta = i \sin \theta$$

Trigonometrical.

$$\sin \theta = \sqrt{1 - \cos^2 \theta} = \frac{\tan \theta}{\sqrt{1 + \tan^2 \theta}}$$

$$\cos \theta = \sqrt{1 - \sin^2 \theta} = \frac{1}{\sqrt{1 + \tan^2 \theta}}$$

$$\tan \theta = \frac{\sin \theta}{\cos \theta} = \frac{\sin \theta}{\sqrt{1 - \sin^2 \theta}} = \frac{\sqrt{1 - \cos^2 \theta}}{\cos \theta}$$

$$\sin (\theta + \phi) = \sin \theta \cos \phi + \cos \theta \sin \phi$$

$$\cos (\theta + \phi) = \cos \theta \cos \phi - \sin \theta \sin \phi$$

These formulæ are true for negative as well as positive angles, remembering that

$$\sin (-\phi) = -\sin \phi, \cos (-\phi) = \cos \phi$$

$$\sin (\pi - \phi) = \sin \phi, \cos (\pi - \phi) = -\cos \phi$$

From the above

$$\begin{aligned} a \cos \theta + b \sin \theta &= \sqrt{a^2 + b^2} \cos (\theta - \angle b/a) \\ &= \sqrt{a^2 + b^2} \sin (\theta + \angle a/b) \end{aligned}$$

From the above, also,

$$\sin 2\theta = 2 \sin \theta \cos \theta$$

$$\cos 2\theta = \cos^2 \theta - \sin^2 \theta = 2 \cos^2 \theta - 1 = 1 - 2 \sin^2 \theta$$

$$2 \sin^2 \theta = 1 - \cos 2\theta, \quad 2 \cos^2 \theta = 1 + \cos 2\theta$$

$$\sin 3\theta = 3 \sin \theta - 4 \sin^3 \theta$$

$$\cos 3\theta = 4 \cos^3 \theta - 3 \cos \theta$$

$$2 \sin \theta \sin \phi = \cos (\theta - \phi) - \cos (\theta + \phi)$$

$$2 \cos \theta \cos \phi = \cos (\theta - \phi) + \cos (\theta + \phi)$$

$$2 \sin \theta \cos \phi = \sin (\theta + \phi) + \sin (\theta - \phi)$$

CAPACITY OF ANTENNÆ.

For a single wire of length l , and diameter d , suspended at a height h above the ground, the capacity is

$$C = \frac{0.2416l}{\log_{10} \frac{4h}{d} + \log_{10} \left(\frac{l/2 + \sqrt{l^2/4 - d^2/4}}{l/2 + \sqrt{l^2/4 - 4h^2}} \right)}$$

Usually the diameter d may be neglected in comparison with the length l , and the following equations are convenient for numerical computations.

$$\text{For } \frac{4h}{l} = 1, \\ <$$

$$C = \frac{0.2416l}{\log_{10} \frac{4h}{d} - k_1}$$

$$\text{For } \frac{l}{4h} = 1, \\ <$$

$$C = \frac{0.2416l}{\log_{10} \frac{2l}{d} - k_2}$$

in which the quantities

$$k_1 = \log_{10} \left(\frac{1 + \sqrt{1 + \left(\frac{4h}{l} \right)^2}}{2} \right)$$

and

$$k_2 = \log_{10} \left(\frac{l}{4h} + \sqrt{1 + \left(\frac{l}{4h} \right)^2} \right)^2$$

may be interpolated from Table 6.

ATOMIC AND ELECTRONIC DATA

The radius of a hydrogen molecule is 1.2×10^{-8} cms.

The mass of a hydrogen molecule is 3.3×10^{-24} gms.

The average velocity of a molecule in air at 15° C. is 459 metres per second.

The mean free path of a molecule in air at atmospheric pressure is 1.42×10^{-5} cms.; in a soft valve of typical pressure .5 mm. the mean free path is 2.16×10^{-2} cms.; while in a hard valve of pressure 10^{-6} mm. the mean free path is 12,500 cms.

The number of molecules per cc. at atmospheric pressure is 2.75×10^{19} ; thus their average distance apart is 3×10^{-6} cms.

The number of molecules per cc. in a soft valve of pressure .5 mm. is 1.8×10^{16} ; thus their average distance apart is 3.8×10^{-6} cms.

The number of molecules per cc. in a hard valve of pressure 10^{-6} mm. is 3.6×10^{10} ; thus their average distance apart is 3×10^{-4} cms.

The negative charge on an electron is 4.774 electrostatic units or 15.91×10^{-20} coulombs.

The diameter of an electron is 4×10^{-13} cms.

The mass of an electron is 9×10^{-28} gms.

The velocity of an electron after falling through a potential drop of V volts is $6 \times 10^7 \sqrt{V}$ cms. per second; thus after falling through a potential of 100 volts the electronic velocity is $6 \times 10^7 \times \sqrt{100} = 6 \times 10^8$ cms. per second.

COMPANIES ENGAGED IN THE
COMMERCIAL DEVELOPMENT
OF WIRELESS TELEGRAPHY
AND TELEPHONY

PARTICULARS OF COMPANIES ENGAGED IN THE COMMERCIAL DEVELOPMENT OF WIRELESS TELEGRAPHY & TELEPHONY

Amalgamated Wireless (Australasia), Ltd.

Incorporated.—July 11th, 1913, in the State of New South Wales.

Head Office.—"Wireless House," 97, Clarence Street, Sydney, New South Wales.

Melbourne Office.—Wireless House, 422/4, Chancery Lane, Melbourne, and Collins House, Collins Street, Melbourne, Victoria.

New Zealand Office.—"Australasia Chambers," Customs House Quay, Wellington, New Zealand.

Directors.—Sir William Vicars, C.B.E. (Chairman), Rt. Hon. W. M. Hughes, K.C., E. T. Fisk, Esq., Member I.R.E., C. P. Bartholomew, Esq., G. Mason Allard, Esq., F.C.P.A., Capt. T. Langley-Webb, J. Stinson, Esq.

Managing Director.—Ernest T. Fisk.

Assistant Manager and Secretary.—J. F. Wilson, A.C.I.S.

Accountant.—F. W. Larkins, A.I.I.A., A.C.I.S.

Transocean Radio Service.—Chief Engineer, Traffic Manager, and other Executives to be appointed.

Coastal Radio Service.—Manager.—L. A. Hooke. Superintendent.—G. Weston.

Marine Radio Service.—Traffic Manager.—J. L. Mulholland. Equipment Manager.—D. Campbell.

Radio Concert Service.—Temporary Staff.

Radio Electric Works.—Manager.—S. M. Grime. Assistant Manager.—E. A. Horner.

Technical, Research and Patents Department.—Superintendent.—G. Apperley.

Branch Managers.—L. A. Hooke, Victoria. G. Robertson, New Zealand.

Capital.—Authorised, £1,000,000. Subscribed capital issued, June 30th, 1922:—

181,400 Fully paid shares	£181,400	0	0
762,636 Shares paid to 2s.	76,263	12	0
40,882 Shares paid to 1s.	2,044	2	0
	£259,797 14 0		

The Company has acquired an exclusive and perpetual license to use and exploit in Australia and New Zealand, together with certain rights in other British territories in the Pacific and Indian Oceans, the present and future patents of Marconi's Wireless Telegraph Company Ltd., London, Radio Corporation of America, as well as the Telefunken system, and a prominent French system. It also has rights to the patents of the Poulsen Pedersen arc system.

Of the 1,000,000 ordinary shares, 500,000 shares are held by the Commonwealth Government. The Board consists of seven Directors, three appointed by the Government, three appointed by the private shareholders, and a seventh Director elected by a majority vote of the other six, or appointed by arbitration. In September, 1922, the Prime Minister of the Commonwealth, Rt. Hon. W. M. Hughes, K.C., was nominated by the Cabinet for the position of seventh Director, and unanimously elected by the other Directors. Sir William Vicars, K.B.E., one of the Government Directors, is Chairman of the Company.

An agreement was made in March, 1922, between the Commonwealth Government and the Company, providing for the establishment of direct wireless communication between Australia and Great Britain; feeder services between the main trunk station and the capital city of every State; re-organisation and re-equipment of the existing coastal service, and for the future development of all branches of wireless communication within Australia and between Australia and countries over seas. In the event of an outbreak of war, the entire organisation of the Company will become a unit of the defence forces of the Commonwealth.

The Company has an extensive manufacturing works in Sydney, in which all classes of radio apparatus, including electronic valves, are produced; it owns and operates 28 wireless stations within the Commonwealth and its territories, in addition to 200 stations on board Australian and New Zealand ships.

Accounts.—The accounts are made up to June 30th in each year. The profit and loss account for the twelve months ended June 30th, 1922, shows that the gross profit from trading and revenue from wireless stations amounted to £63,165 5s. 8d., and after deducting all expenses and providing for reserves, there was a net profit of £9,251 10s. 7d., from which a dividend at the rate of 6 per cent. per annum was paid. The reserve accounts at June 30th, 1922, stood at £51,190 1s.

Dividends.—1913-14, 4 per cent. 1914-15, 6 per cent. 1915-16, 5 per cent. 1916-17, 5 per cent. 1917-18, 5 per cent. 1918-19, 5 per cent. 1919-20, 5 per cent. 1920-21, 6 per cent. 1921-22, 6 per cent.

American Radio and Research Corporation

Incorporated.—June 15th, 1915.

Head Office.—Medford Hillside, Massachusetts.

District Offices.—21, Park Row, New York City, New York, U.S.A. 220, South State Street, Chicago, Ill., U.S.A.

Directors.—J. Axten, Havens Grant, and H. J. Power.

Vice-President and General Manager.—Harold J. Power.

Secretary.—Havens Grant.

Capital.—\$300,000.

Dividends.—Close corporation.

Trade Names.—Amrad Radio Products and Twin-R Electrical Specialities.

The Company designs and manufactures fractional horse-power motors and accessories, wireless telegraph and telephone apparatus.

British Broadcasting Company (The)

Founded.—1922.

Head Office.—Magnet House, Kingsway, W.C.2 (Temporary).

Directors.—Lord Gainford (Chairman), Godfrey Isaacs, John Gray, Henry M. Pease, Sir Wm. Noble, Major Basil Binjon, C. F. Elwell, Archibald McKinsley.

Secretary.—Anderson.

The shares may be allotted or disposed of as the Board may determine, provided that the Board shall not, without the previous written approval of the Postmaster-General allot more than 60,000 shares in the united capital to the following six companies or their nominees:—

Marconi's Wireless Telegraph Company, Ltd.

Metropolitan-Vickers Electrical Co., Ltd.

Radio-Communication Co., Ltd.

British Thomson-Houston Co., Ltd.

General Electric Co., Ltd.

Western Electric Co., Ltd.

and that the Board shall, up to a total of 39,994 shares, issue to applicants, being *bona fide* British manufacturers of wireless apparatus other than the above six companies, the full amount of shares (not exceeding 10,000 to any one applicant) for which applicants may apply.

Chinese National Wireless Telegraph Company (The)

Incorporated.—Under Special Charter by virtue of an agreement dated May 24th, 1919, between the Government of the Republic of China and Marconi's Wireless Telegraph Company, Ltd.

Office.—5, Peh Ch'a Ta Fu Ssu, Peking.

Directors.—Lieut.-Gen. Ting Ching (Chairman), Rear-Admiral Chen Ngen Tao, Godfrey C. Isaacs, T. A. Barson, A. H. Ginman (Vice-Chairman and Managing Director).

Secretary.—Sohstu G. King.

Capital.—Authorised £700,000 in 700,000 shares of £1 each.

The Company was formed to manufacture, sell and maintain wireless telegraph and telephone apparatus in China, and has been granted a license by Marconi's Wireless Telegraph Company, Ltd., giving it the sole right to use in China all the Marconi Company's Patents, present and future, for wireless telegraphy and telephony.

Compagnie Radic-Maritime

Incorporated.—April 24th, 1919.

Head Office.—79, Boulevard Haussmann, Paris.

Directors.—MM. Bousquet (President), Baron de la Chevrelère (Vice-President), N. Pietri, E. Girardeau, E. Sins, Dal Piaz, Musnier, and Max Robert.

Managing Director.—M. N. Pietri.

Capital.—5,000,000 francs, divided into 50,000 shares of 100 francs each.

The Company owns and operates wireless telegraph apparatus on merchant vessels.

The Company also operates aeroplane wireless stations.

Compagnie Générale de Télégraphie Sans Fil

Incorporated.—February 5th, 1918.

Head Office.—79, Boulevard Haussmann, Paris.

Directors.—H. Bousquet (President), Baron de la Chevrelère (Vice-President), E. Girardeau (Administrator), A. L. Atthalin, M. Bloch, A. Dupont, Godfrey C. Isaacs, E. May, N. Pietri, E. Sins, Paul Gauthier, L. Wibratte, Baron Jacques de Gunzburg.

Managing Director.—E. Girardeau.

Chief Engineer.—Major Brenot.

Capital.—50,000,000 francs, divided into 100,000 shares of 500 francs each, subscribed and fully paid; 32,000 Parts Bénéficiaires have also been issued.

The financial year ends December 31st.

Companhia Nacional de Comunicações Sem Fio

Incorporated.—March 29th, 1922.

Head Office.—107, Rua 1^o de Marco, Rio de Janeiro.

Directors.—Dr. Rodrigo Octavio Filho, Louis Edgar Sanceau.

President.—Dr. Rodrigo Octavio Filho.

Managing Director.—Louis Edgar Sanceau.

Capital.—Rs.600:000 \$000 divided into 6,000 shares of 100\$000 each.

The objects of the Company are to exploit various patents of the Marconi Co., as also to act as agents for them.

Compania Radiografica Internacional de Costa Rica

Incorporated.—

Head Office.—San Jose.

Directors.—Mr. Arturo Volio Jiménez, Dr. Autorio Aniceto Facio Villosa.

President.—Mr. José Joaquín Carranza Volio.

Vice-President.—Mr. Ricardo Pacheco Lara.

Treasurer and Secretary.—Mr. Nicolas Peña.

Auditors.—Mr. Porfirio Góngora Umaña, Mr. Juan Gomez Alvarez, Mr. Oscar Monteclegre Gutierrez.

Manager.—Mr. José Joaquín Carranza.

Deputy Manager.—Mr. Ricardo Pacheco Lara.

Capital.—\$10,000 (gold American), 100 Shares.

The Company was formed solely and exclusively for the exploitation of the concession relating to wireless communications which is the property of Messrs. José Joaquín Carranza Volio and Ricardo Pacheco Lara, according to the contract made with the supreme Government on May 5th, 1921, and approved by decree No. 47 of July 25th, 1921.

Companhia Radiotelegraphica Brasileira

Incorporated.—August 14th, 1919.

Head Office.—107, Rua 1^o de Marco, Rio de Janeiro.

Directors.—Pedro A. Nolasco Pereira da Cunha, Louis Edgar Sanceau.

President.—Pedro A. Nolasco Pereira da Cunha.

Managing Director.—Louis Edgar Sanceau.

Members of the Fiscal Council.—Dr. Mario de Andrade Ramos, Señor Henrique Lage, Señor Joao Gentil de Mello Araujo.

Members of the Supplementary Council.—Jack Maurice, Dr. Rodrigo Octavio Filho, Señor Roberto Cardoso.

Capital.—Rs.200:000 \$000 (two hundred contos de reis) divided into 2,000 (two thousand) shares of 100\$000 (hundred milreis) each.

The objects of the Company are to exploit the contract made with the Government of Brazil for the erection of high power stations for direct communication with Europe and the United States.

Compania Marconi de Telegrafia Sin Hilos del Rio de La Plata

Incorporated.—August 4th, 1906.

Head Office.—Calle San Martin 459, Buenos Aires, Argentina.

Directors.—Captain Guillermo José Nunes (President), Señor Florence O'Driscoll (Managing Director), Colonel Sir Thomas Holdich, K.C.M.G., K.C.I.E., C.B., Godfrey C. Isaacs, Senatore G. Marconi, G.C.V.O., LL.D., D.Sc., Señor Duncan Munro, Señor J. A. Pilling, Señor Carlos Pereira Pinto, Señor Enrique Schlieper, Sidney F. St. J. Steadman, Señor Antonio Terrarosa.

Secretary.—Enrique Schlieper.

Treasurer.—J. A. Pilling.

Auditor.—Herbert K. James.

Engineer.—E. Berry.

Capital.—\$2,000,000 gold, represented by 250,000 shares of \$5 gold each, series "AA," fully paid, and 150,000 Preference shares, 5 per cent. (non-cumulative) of \$5 gold each, series "BB," 35 per cent. has been called up on the "BB" shares. The balance is payable in instalments of 10 per cent. with not less than thirty days' notice. The financial year of the Company ends on May 31st.

The Company owns the Marconi patents and patent rights for the Argentine Republic, and has licenses from Marconi's Wireless Telegraph Company, Limited, and the Marconi International Marine Communication Company, Limited, to work the Marconi system in the Republics of Argentina, Uruguay, and Paraguay. The Company has the permission of the Government to erect wireless telegraph stations within the territorial limits of the Argentine Republic and on vessels flying the Argentine flag. The Company is constructing a high-power wireless station in the Argentine Republic to communicate direct with a similar station in Europe.

Compañía Nacional de Telegrafía Sin Hilos

Incorporated.—December 24th, 1910.

Head Office.—Calle de Alcalá, 43, Madrid.

Branch Offices.—Ronda de la Universidad 35, Barcelona; Buenos Aires 13, Bilbao.

Directors.—Excmo. Sr. General Don José de Bascaran; Excmo. Sr. Sentore G. Marconi, G.C.V.O., LL.D., D.Sc.; Godfrey C. Isaacs; Excmo. Sr. Don Antonio Comyn, Conde Vo. de Albiz; Excmo. Sr. Don Eduardo Estelat; Excmo. Sr. Don Francisco Setuain; Sr. Don Jaime Macnaughtan; Don A. Gálvez Canero; Don Carlos de Albert Despujol.

Secretary.—Sr. Don José Asensio.

Capital.—6,500,000 pesetas, divided into 8,000 6 per cent. Participating Preference shares of 500 pesetas each, and 5,000 Ordinary shares of 500 pesetas each, all issued and fully paid.

The financial year ends on December 31st.

This Company took over the concession from the Spanish Government for the construction and exploitation of a public wireless telegraph service in Spain and its colonies. The Company has ten wireless telegraph land stations erected and working at Aranjuez, near Madrid, Cadiz, Barcelona, Tenerife, Las Palmas, Vigo, Soller, Finisterre, Santander, and Cape Palos, and has further stations in course of construction. The Company holds an exclusive license from Marconi's Wireless Telegraph Company, Limited, to use and exploit its patents in Spain and her colonies.

The Company has established a direct wireless telegraph service between Spain and England, via Madrid and London, with Germany via Madrid and Barcelona and Nauen, with Austria and Hungary via Barcelona and Budapest, with France via Sainte Assise, with Italy via Barcelona and Coltano, with Switzerland via Madrid and Berne, and with North, Central and South America via Madrid and London Marconi.

Compagnie Radio-France

Head Office.—Paris, 79, Boulevard Haussmann.

General Offices and Showrooms.—166, Rue Montmartre, Paris.

Directors.—Jules Cambon (President), Henri Bousquet, Emile Girardeau, Nicolas Pietri, Louis Wibratte, Marcel Bloch, Baron de la Chevrelière, André Dupont, Paul Gauthier, André Laurent Athalin, Ernest May, Henri-Valentin Mehu.

Capital.—Fr. 60,000,000.

The Company which owns the Radio Transmitting Centre of Ste. Assise and the Radio Receiving Centre of Villecresnes, maintains public radiotelegraphic communication with Great Britain, America, Spain, etc. It also supplies material and apparatus and erects wireless stations of any power for telegraphic or telephonic communication.

Drahtloser Übersee-Verkehr A.G. (Transradio)

Founded.—1918.

Head Office.—Berlin, S.W.11, Hallesches-Ufer 12/13.

Founded by the Allgemeine Elektrizitäts-Gesellschaft, Siemens & Halske A.G. and the Gesellschaft für drahtlose Telegraphie m.b.H. (Telefunken), Berlin. The Company was formed to exploit installations for wireless telegraphy and telephony in Germany and other countries.

Directors.—Fritz Karl Solff.

The Company has substantial interests in the Transradio, Compania Radiotelegráfica Argentina S.A., Buenos Aires.

Federal Telegraph Company (The)

Incorporated.—In the State of California, in 1911.

Offices.—Hobart Building, San Francisco, California.

Factory.—Palo Alto, California.

Directors.—R. P. Schwerin, Leon Bocqueraz, Hiram W. Johnson, Jun., Alexander Hamilton and B. E. Alanson.

President.—R. P. Schwerin.

Vice-President.—Leon Bocqueraz.

Secretary.—Augustus Taylor.

Treasurer.—J. E. Godcharles.

Capital.—\$2,500,000; 250,000 shares, par value each \$10.00.

The Company was formed for the operation of wireless telegraphy and the manufacture of the Poulsen Arc and other wireless sets.

Gesellschaft für Drahtlose Telegraphie m.b.H. (Telefunken)

Incorporated.—June 15th, 1903.

Head Office.—Hallesches Ufer 12/13, Berlin, S.W.11.

Directors.—Dr. Ing. e.h. Count von Arco, Dr. Ing. C. Schapira, Fritz Ulfers, Dr. Emil Mayer, Hans Bielschowsky.

Founded by the Allgemeine Elektrizitäts-Gesellschaft, Berlin, and Siemens and Halske A.G., Berlin, for the exploitation of the patents of Professor Slaby, Professor Braun, and Count von Arco all over the world.

The Company whose shares are in the sole possession of the Allgemeine Elektrizitäts-Gesellschaft and Siemens and Halske, Berlin, is interested in the following companies:—

Amalgamated Wireless Co., Sydney.
 Det Norske Radioselskap (System Teunken), Kristiania.
 Deutsche Betriebsgesellschaft für drahtlose Telegrafie m.b.H., Berlin (Debeg).
 Deutsche Südsee-Gesellschaft für drahtlose Telegrafie A.-G., Berlin.
 Drahtloser Übersee-Verkehr, A.-G., Berlin (Transradio).
 Eilvese G.m.b.H., Berlin.
 Société Anonyme Internationale de Télégraphie sans Fil, Brussels.
 Società Radiotelegrafica Italiana, Rome.
 Svenska Aktiebolaget Tradloes Telegraf, Stockholm.
 Telefunken-Marconi Code A.-G., Berlin.
 Telefunken, Ostasiatische Gesellschaft für drahtlose Telegraphie m.b.H., Shanghai.
 Transradio Compañia Radiotelegrafica Argentina S.A., Buenos Aires.

International Radiotelegraf & Telefon Compagni (Irotco)

Registered.—June 30th, 1920.

Head Office.—Sct. Annaegaard, Dronningensgade 68, Copenhagen C.

Engineer's Office and Laboratory.—Prinsessegade 29B, Copenhagen C.

Directors.—Commander H. Haagensen, H. A. Wahnöe, W. A. Peters.

Capital.—Danish crowns, 100,000.

The Company was formed for the purpose of the construction and manufacture of radiotelegraphic and radiotelephonic apparatus of all kinds for land, as well as sea and air.

Independent Wireless Telegraph Company, Inc.

Incorporated.—February 12th, 1919, in the State of Delaware, U.S.A.

Head Office.—42, Broadway, New York, U.S.A.

European Office.—7, Hobart Place, London, S.W.1., England.

Factory.—Port Chester, New York, U.S.A.

Directors.—P. R. Mallory, C. J. Pannill, C. D. Mallory, and Frank C. Munson.

President.—P. R. Mallory.

Vice-President and General Manager.—C. J. Pannill.

Treasurer.—F. H. Seeley.

European Superintendent.—D. J. Heilig.

Capital and Dividends.—Close Corporation.

The Company was formed for the operation of wireless telegraphy and the manufacture of wireless telegraph apparatus.

Marconi International Marine Communication Company, Limited (The)

Incorporated.—April 25th, 1900.

Head Office.—Marconi House, Strand, London, W.C.2.

Directors.—Senatore G. Marconi, G.C.V.O., LL.D., D.Sc. (Chairman), Godfrey C. Isaacs (Deputy Chairman and Managing Director), Alfonso Marconi, Capt. H. Riall Sankey, C.B., C.B.E., R.E. (retired), Henry W. Allen, F.C.I.S., W. W. Bradfield, C.B.E., M. A. Bramston, S. F. St. J. Steadman, Sir Charles J. Stewart, K.B.E., Rt. Hon. Lord Herschell, G.C.V.O., and Lt.-Col. A. Simpson, C.M.G., R.E. (retired) (Deputy Managing Director).

Joint General Managers.—W. W. Bradfield, C.B.E., Henry W. Allen, F.C.I.S.

Assistant General Manager.—F. S. Hayburn.

Secretary.—A. Ogle, M.C., A.C.I.S.

Marine Superintendent.—Capt. C. V. Daly.

Contract Manager.—A. R. Harding.

Technical Manager.—Commander J. A. Slee, C.B.E., R.N.

Capital.—£1,500,000 in shares of £1 each, issued and fully paid £1,192,726. (The capital was increased in May, 1919, by 900,000 shares of £1 each, of which 600,000 were offered to existing shareholders pro rata at par.) 5½ per cent. First Mortgage debentures (bearer)—authorised £250,000, issued £125,000 outstanding £59,280. Secured (without trust deed) as a floating charge on the undertaking and all the property. Redeemable at par, July 1st, 1941. Interest payable, January 1st and July 1st.

Accounts and Dividends.—Accounts are made up to December 31st and usually submitted in June following. The accounts at December 31st, 1921, showed, after deduction of £20,000 paid on account of Excess Profits Duty, a profit of £144,595, which included the amount brought forward. After payment of dividend £25,322 was carried forward subject to Excess Profits Duty for years 1916 to 1920 inclusive, less amount paid on account, and Corporation Profits Tax for 1920 and 1921.

Dividends paid, 1910, 5 per cent.; 1911, 7 per cent.; 1912, 1913 and 1914, 10 per cent.; 1915, 12½ per cent.; 1916, 1917, 1918, 1919 and 1920, 15 per cent.; 1921, 10 per cent.; 1922, 5 per cent. Interest paid 6th January, 1923.

Last Bearer Coupon paid, No. 22.

This Company was formed for the purpose of working throughout the world, except in the United States of America, Hawaii, Chili, and colonies or dependencies of those States, an exclusive license for all maritime (being mercantile or yachting) purposes granted by Marconi's Wireless Telegraph Company, Limited. The Company has transferred to Associated Companies its rights in Canada, Argentina, Uruguay, Australasia, and all European countries and their dependencies except the United Kingdom and Italy. This Company owns and operates the wireless telegraph apparatus on about 3,000 vessels of the mercantile marine.

Marconi Scientific Instrument Company, Limited (The)

Incorporated.—November 1st, 1919.

Registered Office and Works.—70, Dudden Hill Lane, Willesden.

Directors.—William W. Drury (Managing Director), Henry W. Allen, F.C.I.S., W. W. Bradfield, C.B.E., R. D. Bangay.

Secretary.—Arthur J. Wheeler, A.C.I.S.

Capital.—Authorised £40,000 in 40,000 shares of £1 each.

The Company was formed to manufacture and sell amateur wireless telegraphic and telephonic apparatus under license from Marconi's Wireless Telegraph Company, Limited. Also to manufacture and market all classes of land-line and submarine cable apparatus.

"Marconi" Societate Anonima Română Pentru Industria Si Comertul de Materiale Telegrafice, Telefonice Si Electrice

Incorporated.—April 5th, 1920.

Amalgamated with "Radioelectrica" Societate Anonimă Română pentru industria si comertul materialelor telegrafice si telefonice, with effect from October 27th, 1921.

Present Name.—"Radioromana" Societate Anonimă Română pentru industria si comertul materialelor telegrafice si telefonice.

Address of Head Office.—4, Strada Saguna, Bucharest.

Directors.—Prince Barbu Stirbey (President), C. P. Olănescu (Vice-President), N. Vasilescu-Karpen, Godfrey Isaacs, Alex. Tzigara-Sumurcas, Capt. Edwin Boxshall, C. D. Busilă, Cezar Boerescu, D. Leonida, Emile Girardeau, Paul Mangard.

Managing Directors.—C. Busilă, Paul Mangard.

General Manager.—Eugen Craioveanu.

Secretary.—Major A. A. O'Kelly.

Capital.—12,000,000 lei. 24,000 fully paid-up shares of 500 lei each.

The Company was formed for the manufacture, supply and installation of all kinds of telegraphic and telephonic apparatus, including wireless.

Marconi Wireless Telegraph Company of Canada, Limited (The)

Head Office.—Marconi Building, 9-11-13, Saint Sacrament Street, Montreal, Canada.

President.—C. G. Greenshields, K.C.

Vice-Presidents.—Senatore G. Marconi, G.C.V.O., LL.D., D.Sc., Robert Bickerdike, A. E. Dymont.

Directors.—Godfrey C. Isaacs, G. M. Bosworth, H. W. Allen, F.C.I.S.

General Manager.—H. M. Short.

Comptroller and Acting Secretary.—J. P. Fleming.

Traffic Manager.—G. H. Pearson, Assoc.I.R.E. (New York).

Chief Engineer.—J. H. Thompson, B.Sc., A.M.I.R.E. (New York), A.M.I.E.E. (New York), A.M.I.C.E. (Canada).

Authorised Capital.—\$7,500,000 in 3,000,000 shares of \$2.50 each.

Issued Capital.—5,700,000 shares.

The Company has 50% wireless rights under all Marconi and General Electric Company patents in the Dominions of Canada and Newfoundland. It is the only Company in Canada manufacturing wireless apparatus and providing wireless service. It owns and operates the wireless equipment on over two hundred ships of the Canadian and Newfoundland Mercantile Marines, and also owns and operates the duplex, transatlantic, commercial wireless telegraph station at Glace Bay in Nova Scotia.

The Company operates under contract with the Canadian and Newfoundland Governments, about forty wireless stations in the Great Lakes, Gulf of St. Lawrence, and on the Atlantic Coast. It has branch offices in Vancouver, B.C., Toronto, Ont., St. John, N.B. (winter), and St. John's (Nfld.). It owns and operates schools of radiotelegraphy in Montreal, Toronto, and St. John's (Nfld.).

Marconi's Wireless Telegraph Company, Limited

Incorporated.—July 20th, 1897, as "Wireless Telegraph and Signal Co., Ltd."; name changed as above in March, 1900.

Head Office.—Marconi House, Strand, London, W.C.2.

Works.—Chelmsford, Essex.

Directors.—Senatore G. Marconi, G.C.V.O., LL.D., D.Sc. (Chairman), Godfrey C. Isaacs (Deputy-Chairman and Managing Director), Captain H. Riall Sankey, C.B., C.B.E., R.E. (retired), Alfonso Marconi, Henry W. Allen, F.C.I.S., M. A. Bramston, S. F. St. J. Steadman, Sir Charles J. Stewart, K.B.E., Rt. Hon. Lord Herschell, G.C.V.O., Lt.-Col. Adrian Simpson, C.M.G., R.E. (retired) (Deputy Managing Director) and The Rt. Hon. F. G. Kellaway, P.C.

Joint General Managers.—W. W. Bradfield, C.B.E., Henry W. Allen, F.C.I.S.

Assistant General Managers.—G. E. Turnbull and H. W. Corby, F.C.I.S.

Secretary.—A. Ogle, M.C., A.C.I.S.

Chief Engineer.—Andrew Gray, M.I.E.E., A.M.Inst.C.E.

The Company was formed to acquire Senatore Marconi's patents for wireless telegraphy in all countries except Italy, its colonies and dependencies, and has since acquired a large number of other patents relating to wireless telegraphy, including those of Sir Oliver Lodge, the General Electric Company of New York (except for America), etc.

It has substantial interests in various subsidiary and affiliated Companies.

The Company conducts public wireless telegraph services, and messages are accepted for transmission, via Marconi, to the United States of America, Central and South America, Canada, Australia New Zealand, the West Indies, British Guiana, British Honduras, Spain, France, Switzerland, etc.

Accounts and Dividends.—Accounts are made up to December 31st, and usually submitted in June following. The Company's accounts at December 31st, 1921, showed shares in Associated Companies and Patents, £3,237,213 (par value of shares, £4,149,584), and General Reserve Account £3,986,914. The profit for the year, together with the balance brought forward, was £1,093,928, and after payment of dividends, £666,830 was carried forward.

In respect of each of the years 1911, 1912 and 1913, the Company paid dividends of 17 per cent. on the Preference shares and 20 per cent. on the Ordinary shares; in respect of 1914 and 1915, 7 per cent. Preference and 10 per cent. Ordinary dividends were paid; in respect of 1916 the dividends were 12 per cent. on the Preference shares and 15 per cent. on the Ordinary shares; in respect of 1917 the dividends were 17 per cent. on Preference shares and 20 per cent. on the Ordinary shares. For 1918 dividends of 22 per cent. on the Preference shares and 25 per cent. on the Ordinary shares were paid. For 1919 dividends of 22 per cent. on the Preference shares and 25 per cent. on the Ordinary shares were paid, plus a bonus of 5s. per share on both Preference and Ordinary shares. For 1920 and 1921, dividends of 12 per cent. on the Preference shares and 15 per cent. on the Ordinary shares were paid. 1922 7 per cent. Preference and 5 per cent. interest on Ordinary paid February 1st, 1923. (Last Bearer Coupons paid: No. 24 Preference, No. 23 Ordinary.)

Capital.—Authorised £4,000,000 in 3,750,000 Ordinary shares of £1 each, and 250,000 Cumulative Participating Preference shares of £1 each. Issued 2,750,000 Ordinary shares of £1 each, and 250,000 Preference shares of £1 each. The Preference shares are entitled to a cumulative dividend of 7 per cent., and, after the Ordinary shares have received a 10 per cent. non-cumulative dividend, to share *pari passu* with the latter shares in surplus profits remaining.

6½ per cent. Ten Year Convertible First Debenture Stock. Authorised, £3,000,000. Issued, £1,500,000. Secured as a first floating charge on all the Company's assets present and future, including uncalled capital (if any). Repayable on or before October 1st, 1932.

Stockholders have right to convert on any January 1st, April 1st, July 1st and October 1st, between April 1st, 1923, and April 1st, 1929, all or any part of their holding into ordinary shares on the basis of one fully paid share of £1 for each £3 of debenture stock.

Interest payable half-yearly on April 1st and October 1st.

Nederlandsche Seintoestellen Fabriek

Incorporated.—February 27th, 1918.

Head Office and Works.—Jan v. d. Heydenstraat, Hilversum, Holland.

Directors.—Bern E. Ruys (President), G. L. Tegelberg (Commissaire Délégué), D. Hudig, L. Jzn. J. M. Goudriaan, J. H. Hummel, A. E. J. Bertling, A. Veder, G. C. Isaacs, G. E. Turnbull, J. Rypperda Wierdsma.

Manager.—A. Dubois.

Capital.—3,000,000 florins, divided into 3,000 shares of 1,000 florins each.

The financial year ends, December 31st.

The Company was formed for the purpose of exploiting a factory or factories for the manufacture of installations, apparatus and tools destined for or relating to wireless telegraphy, telephony, signalling apparatus, etc., and trading in the above-mentioned apparatus. It has entered into an agreement with Marconi's Wireless Telegraph Company, Limited, whereby the latter Company grants to the N.S.F. the exclusive right to manufacture and sell in Holland and the Dutch Colonies wireless material according to its Patents and designs, present and future.

Representatives for Holland and Colonies.—For the New Antwerp Telephone and Electrical Works at Antwerp and The Society Belge Gardy, Manufacturers of electrical supplies as switches, fuses, transformers, insulators, etc., at Uccle-Calevoet, Belgium, near Brussels.

Nederlandsche Telegraaf Maatschappij, "Radio-Holland"

Incorporated.—December 6th, 1916.

Head Office.—562 Keizersgracht, Amsterdam.

Directors.—D. Hudig L. Jzn (President), J. Rypperda Wierdsma, A. J. M. Goudriaan, T. H. de Beaufort, G. L. Isgelberg, P. J. Roosegaarde Bisschop, H. Colyn, Prof. C. L. van der Bilt, J. F. van Hengel, Senatore G. Marconi, Godfrey C. Isaacs, Maurice Travailleux, Gaston Périer.

Managing Directors.—L. H. F. Wackers and Th. P. van den Bergh.

Administrator, Dutch East Indies.—W. A. J. Liebert.

Capital.—3,000,000 florins, divided into 3,000 shares of 1,000 florins each, of which 2,000 shares have been issued and fully paid.

The financial year ends at December 31st.

The Company was formed for the purpose of the establishment, sale, hire, control and exploitation of wireless telegraph and wireless telephone stations in Holland and its colonies.

Norsk Marconikompani Aktieselskap

Constituted.—November 28th, 1918.

Head Offices.—Karl Johansgate 5, Kristiania.

Branch Office.—Fimmegaardsgaten 6, Bergen.

Capital.—1,250,000 Kroner, divided into 1,250 registered shares of Kroner 1,000 each.

Directors.—Otto Thoresen (Kristiania), Godfrey C. Isaacs (London), Commander J. Bull (Horten), K. Zimmer (Bergen), L. Kloster (Kristiania), G. E. Turnbull (London).

Deputy Directors.—A. Hubert (Bruxelles), J. Ringstad (Drammen).

Managing Director.—E. S. Skottun.

Technical Manager.—B. L. Gottwaldt.

This Company was constituted for the manufacture, sale, and rental of apparatus for Wireless Telegraphy, Telephony, Signalling, etc., and other business in connection therewith. It has acquired the Marconi patent rights, present and future, for exploitation in Norway and on board ships flying the Norwegian flag.

Pan-American Wireless Telegraph and Telephone Company (The)

Incorporated.—State of Delaware, U.S.A. Amended Certificate of Incorporation, October 18th, 1917.

Offices.—233, Broadway, New York City.

Directors.—Hon. John W. Griggs, Edward J. Nally, James R. Sheffield, David Sarnoff, Edward W. Harden, Albert G. Davis, C. B. Coady, R. Mainzer, R. P. Schwerin.

Chairman.—Hon. J. W. Griggs.

President and General Manager.—Edward J. Nally.

Vice-President and Commercial Manager.—David Sarnoff.

Vice-President.—Powhatan Page.

Secretary.—Charles J. Ross.

Treasurer.—George S. De Sousa.

Assistant Secretary and Assistant Treasurer.—L. MacConnach.

Capital.—3,500 shares 7 per cent. preferred stock of \$100 each, cumulative after January 1st, 1921; 50,000 shares common stock, no par value. The financial year ends December 31st.

The Company has the exclusive right and license to use the Marconi and Poulsen Patents for the sole purpose of radio or wireless communication between the United States of America and all countries of South America, Central America, Mexico, the Islands of Cuba, Porto Rico, and the West Indies.

Radio Communication Company, Limited

Incorporated.—March 14th, 1919.

Head Office.—34/35, Norfolk Street, London, W.C.2.

Directors.—T. W. Stratford-Andrews (Chairman), Sir Wm. R. Brooke, K.C.I.E., J. Herbert Scrutton, Capt. R. S. Hilton, B. Binyon, O.B.E. (Managing Director).

General Manager.—A. B. Snooden.

Secretary.—W. H. C. Rowe, C.B.E.

Capital.—£200,000, divided into 100,000 6 per cent. Cumulative Participating Preference shares and 100,000 Ordinary shares. Issued: 79,502 Ordinary and 81,650 Preference.

The Company was formed under the aegis of the Indo-European Telegraph Company, Limited, for the manufacture, sale and operation of radio apparatus, including "Polar" radio equipment for ships.

Radio Corporation of America

Incorporated.—October 17th, 1919, in the State of Delaware.

New York Office.—Woolworth Building, 233, Broadway, New York City.

Directors.—Owen D. Young (Chairman), E. J. Nally, E. W. Rice, Jun., Hon. John W. Griggs (General Counsel), James R. Sheffield, A. G. Davis, Gordon Abbott, Edward W. Harden, George S. Davis, Guy E. Tripp, Edwin M. Herr, Arthur E. Braun.

President.—Major General James G. Harbord.

Managing Director of International Relations.—Edward J. Nally.

Vice-President and General Manager.—David Sarnoff.

Vice-President and General Attorney.—William Brown.

Secretary.—John W. Elwood.

Assistant Secretary.—L. MacConnach.

Comptroller.—Charles J. Ross.

Treasurer.—George S. de Sousa.

Assistant Treasurer.—M. H. Payne.

Capital.—Authorized: \$25,000,000 Preferred Stock in 5,000,000 shares of \$5 each. There are also 7,500,000 Common shares of no par value. Issued: \$19,779,870 in 3,955,974 Preferred shares of \$5 each, fully paid 5,732,000 Common shares of no par value. Rights: The Preferred Stock is entitled to receive dividends of 7 per cent. per annum and no more. In any distribution of the

assets it is entitled to be paid off at par, prior to any payment to the Common shareholders. The Preferred dividends are cumulative after the fiscal year ending in or with the calendar year 1923, and the Preferred Stock may be retired on any day on which a dividend thereon shall be payable, at \$5.50 per share and accrued dividends.

The Company was formed to acquire certain assets of The Marconi Wireless Telegraph Company of America and all wireless inventions, present and future, of the General Electric Company of New York.

R.M. Radio Limited

Registered.—September 6th, 1919.

Head Office and Engineers' Offices and Show-rooms.—5, Regent Square, Gray's Inn Road, W.C.1.

Directors.—H. R. Rivers-Moore, W. H. Merriman, L. J. Graham, A. G. Ionides, C. N. Rivers-Moore.

Secretary.—W. H. Merriman.

Capital.—£10,000.

The Company was formed for the purpose of constructing, supplying, maintaining and operating radiotelegraphic and telephonic apparatus of all kinds for the purpose of intercommunication on land, at sea, and in the air.

Radio Station, Marconi Société Anonyme.

Incorporated.—February, 1922.

Head Office.—Hotel Principal des Postes, Berne, Switzerland.

Directors.—Dr. F. Truessel (President), Henry W. Allen, Dr. Fürer (Director-General of Telegraphs), M. Chapuisat, M. Usteri, M. Schmidlin, Herbert A. White.

Manager.—Dr. F. Rothen.

Capital.—1,800,000 francs, divided into 3,600 shares of 50 francs each.

The Company has been granted a concession by the Swiss Government for the operation of a station at Berne and it conducts commercial wireless telegraph services with England, Spain and other European countries.

Financial Year.—Ends December 31st.

Russian Company of Wireless Telegraphs and Telephones (The)

Incorporated.—October 8th, 1908.

Head Office.—14, Lopouchinskaja, Petrograd, Russia.

Directors.—Senatore G. Marconi, G.C.V.O., LL.D., D.Sc., G. C. Isaacs, S. M. Eisenstein, Pierre de Balinski, M. Salberg, Lt.-Col. Adrian Simpson, C.M.G., R.E. (Managing Director), Admiral I. F. Bostrem, I.R.N. (retired), L. M. Eisenstein (Deputy Director).

Secretary.—Leon Eisenstein.

Capital.—Originally 1,200,000 roubles in 12,000 shares of 100 roubles each. This capital was increased to 1,800,000 roubles in November, 1911, in order to enable the Company to acquire a license from Marconi's Wireless Telegraph Company, Limited. The capital was further increased in 1913 to 2,400,000 roubles, and in 1914 to 3,000,000 roubles, divided into 30,000 shares of 100 roubles each.

The financial year ends December 31st (Russian date).

Dividends.—In respect of the years 1912 and 1913 dividends of 6 per cent. have been paid and 15 per cent. in respect of 1914 and 1915, and 17 per cent. for 1916.

The Company owns the Russian patents taken out in the name of S. M. Eisenstein, and also holds an exclusive license to use and exploit the Marconi Company's patents in Russia (excluding stations for international communication or on vessels of Russian Mercantile Marine).

The works belonging to the Company were nationalised by decree of the Bolshevik Government in 1918, and since that time have been under Bolshevik control.

Società Anonima Fiumana per le Radio Comunicazioni

Chairman.—Senatore Guglielmo Marconi.

Managing Director.—Marquis Luigi Solari.

Directors.—Ing. Giovanni Rubinich, Prof. Arturo De Meichner.

Censors.—Avv. Ernesto Franchi, Sig. Giovanni Santini, Sig. Giulio Bresci, Sig. Annibale Ploech.

Capital.—L150,000—(Authorised L1,500,000).

Società Italiana Dei Servizi Radiotelegrafici e Radiotelefonici

Head Office.—Corso Umberto 1, 271, Rome.

Chairman.—Senatore Guglielmo Marconi.

Managing Director.—Marquis Luigi Solari.

Directors.—Senatore Angelo Salmoiraghi, Senatore Ernesto Presbitero, Generale Maurizio Mario Moris.

Censors.—Comm. Cesare Cazzulini, Comm. Francesco Pages, Mr. Arthur Cappelaere.

Joint Censors.—Ragioniere Mario Fogliani, Avv. Michele Di Rienzo.

Capital.—L1,000,000.

Société Anonyme Internationale de Télégraphie Sans Fil

Incorporated.—March 31st, 1913.

Head Office.—13, Rue Bréderode, Brussels.

Capital.—4,500,000 francs, divided into 9,000 shares of 500 francs each, all issued and fully paid. The last dividend paid was 15 per cent. for the year 1921.

The financial year ends at December 31st.

The Company exploits wireless telegraphy on vessels of the mercantile marine of all European countries excepting the United Kingdom of Great Britain and Ireland, Germany, Austria-Hungary, Italy and France, and at the present time owns and operates wireless telegraph apparatus on nearly 600 vessels.

Société Belge Radio-Electrique, Société Anonyme.

Incorporated.—October 4th, 1922.

Head Office.—4, Rue d'Egmont, Brussels.

Directors.—M. Félicien Cattier (Président), M.M. Henri Baron Lambert, de Formanoir de la Cazerie, Léon Baron de Steenhault de Waerbeek, Em. Girardeau, Baron Léon Greindl, Maurice Hulin, Godfrey Isaacs, Gaston Périer, Maurice Travailleur, Henry Urban, Firmin Van Brée, Jacques Van Hoegaerden.

Managing Director.—Mr. Maurice Philippson.

Capital.—4,000,000 Francs, divided into 8,000 shares of 500 francs each.

Société Française Radio-Electrique, Société Anonyme

Incorporated.—April 4th, 1910.

Head Office.—79, Boulevard Haussmann, Paris.

Laboratory and Works.—Levallois-Perret (Seine), 2, Quai Michelet.

Big Machine Works.—Belfort : Société Alsacienne de Constructions Mécaniques.

Tower and Pillar Works.—Venissieux (Rhône), 72, Chemin du Moulin à Vent à Parilly.

Chairman.—M. Henri Bousquet.

Vice-Chairman.—M. G. Ferrand.

Financial Directeur.—M. A. Fondère.

Managing Director.—M. E. Girardeau.

Directors.—Comte de Beaumont, Baron de La Chevrelière, P. Desachy, A. Dupont, N. Pietri, O. de Rivaud.

Technical Manager.—Major P. Brenot.

Technical Advisers.—MM. Nethenod, Latour, Boucherot, de Bellescize, Petit.

Capital.—7,000,000 francs, divided into 70,000 shares of 100 francs each, all issued and paid up.

The Company manufactures wireless telegraph apparatus and engines, and erects wireless stations, and also owns and operates the patents of MM. J. Bethenod, E. Girardeau, M. Latour, etc.

It exploits chiefly that system of wireless telegraphy which employs high-frequency machines, the system adopted for all the great stations of France and its Colonies and by various other Governments.

Société Indépendante Belge de Télégraphie Sans Fil, Société Anonyme

Incorporated.—January 29th, 1920.

Head Office.—4, Rue d'Egmont, Brussels.

Directors.—M. Henri Baron Lambert (Président), MM. Van Hoegaerden le Baron de Steenhault, Maurice Philippson, de Formanoir, Wormser, Van Haltern.

Manager.—Major Roland.

Capital.—1,000,000 francs, divided into 2,000 shares of 500 francs each.

Société Indépendante de Télégraphie sans Fil

Head Office.—66, Rue la Boétie, Paris.

Works and Laboratory.—Malakoff 76 Route de Châtillon.

Administrators.—M. M. Boé (Président), F. Bézerie, Maurice, E. Wormser.

Manager.—Mr. Lezard.

Technical Advisers.—M. le Docteur L. Brillouin, G. Beauvais, Laüt, Pécnet.

Capital.—1,500,000 francs, divided into 3,000 shares of 500 francs each, issued and fully paid.

The Company manufactures wireless telegraph and telephonic apparatus, including valves, and constructs and maintains wireless stations, both land and ship. The Company operates the patents of R. Barthelemy, G. Beauvais, R. Brailard, L. Brillouin, R. B. Goldschmidt, P. J. Laüt, Pellin, Pelletier, etc.

Société Radiotechnique en Pologne (Radiopol) Société Anonyme.

Incorporated.—January 3rd, 1920.

Head Office.—22, Rue Wilcza, Warsaw.

Works.—"Strazar Works," 3, Rue Syrene, Warsaw.

General Manager.—Henryk Kolberg.

Directors.—Henryk Korwin Krukowski (President), Henryk Szampanier (Vice-President), Emile Girardeau, Godfrey C. Isaacs, Eugene Hannotiaux, Henryk Kolberg, Dr. Casimir Bajonski, Georges Osmolowski, Comte Henryk Potocki.

Technical Director and Engineer.—Mr. Joseph Pecquet.

Engineer.—Dr. Malecki.

The Company manufactures wireless telegraph and telephone apparatus and exploits the patents and licences relating thereto.

Svenska Radioaktiebolaget.

Incorporated.—July 29th, 1921.

Head Office.—Alstromergatan 12, Stockholm, Sweden.

Directors.—Mr. Axel Lindblad, Mr. Gustaf Dalen, Mr. Oscar Falkman, Mr. Inge Erichs, Mr. Gottlieb Piltz, Mr. Ulrich Salchow, Mr. Godfrey C. Isaacs, Lieut. Col. Adrian Simpson, Mr. G. E. Turnbull.

Manager.—Captain I. Wibom.

Capital.—Kr. 700,000 divided into 7,000 shares of Kr.100 each.

Wireless Speciality Apparatus Company

Incorporated.—June 14th, 1907, New York.

Head Office.—131, State Street, Boston.

Directors.—George S. Davis, William Newsome, Eugene W. Ong, C. B. Davis, R. H. Rice, E. P. Edwards.

President.—George S. Davis.

Vice-President.—William Newsome.

Secretary.—John L. Warren.

Treasurer.—E. C. Porter.

General Manager.—T. Johnson, Jr.

Chief Engineer.—William H. Priess.

Consulting Engineer.—Professor Greenleaf W. Pickard.

Capital.—\$492,000.

The fiscal year ends December 31st of each year.

The Company is engaged in the development and manufacture of radio apparatus and devices and of "Faradon" condensers for both high and low tension work, including condensers of special design for continuous wave radio apparatus.

BIOGRAPHIES

(A) Biographies.

(B) Obituary Notices.

BIOGRAPHICAL NOTICES

Abraham, Henri.—General Secretary of the Société Française de Physique, 1901 to 1913. now Professor of Physics at the Sorbonne in Paris.

Adalsteinsson, F.—Born at Akureyri, Iceland, December 30th, 1890. Since 1908 engaged in the Iceland Government Telegraph Service. Studied wireless telegraphy in Norway and Denmark in 1916 and 1917. Since February, 1917, Superintendent of Reykjavik Wireless Station and School. Supervised erection of four wireless coast stations in Iceland. Inspector of wireless installations in that country. Address, Loftskystodin, Reykjavik, Iceland.

Alexanderson, Ernst Fredrik Werner.—B. Upsala, Sweden, January 25th, 1878. Educ. at the High School and University of Lund, Sweden, and at the Royal Institute of Technology, Stockholm, completing a post-graduate course at Berlin. Entered the service of the C. and O. Electric Company, 1901. Joined the General Electric Company, 1902. Occupies the post of consulting engineer to the latter concern. Chief engineer Radio Corporation of America. Introduced iron into high frequency circuits, and originated the development of 2, 50 and 200 kw. radio frequency alternators and the magnetic amplifier. Also developed the "barrage" receiver and kindred inventions. Has carried on notable pioneer work in duplex radio telephony. Holds a number of United States patents. Member of the American Institute of Electrical Engineers. Fellow and President of the Institute of Radio Engineers. Author of over twenty scientific papers read before various technical societies. Address: Woolworth Building, New York.

Allen, Perry W. (1902).—B. 1870. Met Senatore Marconi, 1896. Assisted (1897) in formation of the Wireless Telegraph and Signal Co., Ltd., afterwards becoming secretary to that company. Secretary of Marconi International Marine Communication Co., Ltd., and Assistant Manager of Marconi's Wireless Telegraph Co., Ltd. (1900). Deputy Manager. Marconi's Wireless Telegraph Co., Ltd. (1910). Elected to a seat on the Board of each company, 1917. Joint General Manager, Marconi's Wireless Telegraph Company, Ltd., and Marconi International Marine Communication Company, Ltd. (1919). Address: Marconi House, Strand, W.C.2.

Appleby, Thomas.—B. May 10th, 1886, near Newcastle-on-Tyne, England. Arrived in America, 1888. Commenced wireless experiments, 1899. Went to sea, 1909, as radio operator. September, 1909, in charge of United Wireless Station at Atlantic City, N.J. April, 1912, in charge of Wanamaker-Marconi Service between New York and Philadelphia Wanamaker Stores. April 9th, 1917, commissioned in the U.S. Navy as a Lieutenant (J.G.) for Radio Engineering. Spring of 1918, established shore radio compass stations for the detection and location of enemy vessels in West Atlantic. Spring of 1919, selected sites for shore radio compass stations on the Pacific Coast of the United States. April 24th, 1919, promoted Senior Lieutenant, U.S. Navy. August 7th, 1919, released from active duty,

U.S. Navy. August 8th, 1919, Radio Engineer in the Office of the Director of Naval Communications and given entire charge of all shore radio compass stations in the United States. November 15th, 1919, resigned from Navy Department to enter profession of Patent Lawyer. M.I.R.E. (Amer.). Address: 5847, Ellsworth Street, Philadelphia, Pa., U.S.A.

Appleton, Edward Victor, M.A. (Cantab. D.Sc. (Lond.))—B. Bradford, 1892. Educ. St John's College, Cambridge. First-class Honours in National Science Tripos, Parts I. and II. (Physics). Served European War, 1914-1919, as Captain W/T, R.E. Specially interested in Thermionic Valves. Engaged in Valve Research, Cavendish Laboratory, Cambridge. Contribution on Valves in *Philosophical Magazine and Radio Review*. Member of Thermionic Valve Sub-Committee, Radio Research Board, Department of Scientific and Industrial Research. Fellow of St. John's College, Cambridge. Member Physical Society of London, Cambridge Philosophical Society. Address: St. John's College, Cambridge.

Arco, Graf Georg von.—B. Grossgorschütz, Schlesien. Educ. at Berlin University and Technical High School, Charlottenburg. Assistant to the late Professor Slaby in the department of wireless telegraphy, 1898; later joined the Allgemeines Elektrizitäts-Gesellschaft, Berlin, continuing at the same time his work on the Slaby-Arco system of wireless telegraphy. Manager of the Gesellschaft für Drahtlose Telegraphie, 1903. Carried out practical wireless telephony over a distance of 35 km. 1906. Exhibited high frequency alternator with static frequency step-up transformers at the International Radiotelegraph Congress in London, 1912. This arrangement is now used in the high power station of Nauen, generating 400 kw. in the aerial. Address: Tempelhof, Berlin, Albrechtstrasse, 49/50.

Armstrong, Edwin H.—B. in U.S.A., December 18th, 1890. Graduated at Columbia University in 1913. Has undertaken radio-telegraphic work in conjunction with Professor Pupin at the Columbia Laboratories. Director of the Institute of Radio Engineers. Recently awarded the medal of the Institute. Served two years in A.E.F. as Captain and Major in the Signal Corps. Decoration: Chevalier Legion d'Honneur. Professor at Columbia University and President of the Radio Club of America. Address: Columbia University, New York City.

Asano, Dr. Osuke.—B. 1859. Graduated at the Engineering College of the Tokyo Imperial University, 1881. Honorary Professor, Tokyo University. Director of the Electro-Technical Laboratory of the Department of Communications, 1897. Retired, 1919. Took many trips to Europe and America, first for the investigation of electrical engineering; second as a Japanese delegate of the International Wireless Telegraph Conference, Berlin, 1906; and third as a Japanese delegate of the International Conference on Electrical Units and Standards, London, 1908. The so-called "Telshinsho" wireless system is due to his investigations.

Laid the submarine cable between Formosa and Osumi in 1895-97, the first long-distance submarine cable ever laid by a Japanese. Raised to the rank of Dr. Engineer, 1899. Supervises all electrical works in Japan. Awarded 2nd Order of Merit, 1914. Address: 148, Kogaicho, Azabu, Tokyo.

Asin, Don Humberto de.—Studied electricity at the University of Santiago. Chief of important technical sections, railways of Guayaquil and Arica at La Paz. Studied radio-telegraphy. Visited San Cristobal, Lima, the School of Santiago, and the two installations which were then at the Docks, Buenos Aires. Commissioned by Bolivian Government to visit Europe. Graduated as radiotelegraphist at the Marconi Company's professional school at Broomfield. Visited Germany to study the Telefunken system. Installed six stations in Bolivia and Trinidad, Cobija. Villa Bella, Concepcion, Magdalena, San Ignacio, Puerto Suarez, Santa Cruz, Todos Santos and many more. Engineer-in-Chief of the Radiotelegraph Service of Bolivia.

Athanasiadis, Capt. Constantin, H.R.N.R., B. Athens, 1878. Educ. Royal Naval College, 1892-96. Torpedo and Electrician Officers' School, 1906. Commissioned in the Navy, 1896, and after eleven years' active service became interested in wireless telegraphy. Supervised the erection of the first wireless installations in Greece. Sent to London, 1909, for a year and a half, by his Government as the head of a mission for the construction of Greek wireless stations. During that period came into close contact with the Marconi organisation. On his return to Greece he was appointed head of the Radiotelegraph Service of the Navy. In November, 1920, he resigned his commission in the Royal Navy, and in 1921 became sole agent for Greece of Marconi's Wireless Telegraph Co., Ltd., and of the Société Anonyme Internationale de T.S.F. Author of Handbook of Wireless Telegraphy, Vol. 2, Elementary Treatise of Wireless Telegraphy (in Greek). Address: Athenian Club, Nikis St. 45, and Adrianou St. 14.

Austin, Louis Winslow, Ph.D., D.Sc.—Son of Professor L. A. Austin, of Middlebury College. Educ. Middlebury College, Clark's University, and the Universities of Strasburg and Berlin. Assistant Professor of Physics at the University of Wisconsin, then joined the staff of the Physikalisches-Technische Reichsanstalt, Berlin. Specially interested in quantitative high-frequency measurements. Head of the U.S. Naval Radiotelegraphic Laboratory, Washington, D.C., since 1903. Delegate to the London International Radiotelegraphic Conference. President I.R.E., 1914; Vice-President of the International Union for Scientific Radiotelegraphy; Delegate to the Radiotelegraphic Technical Conference, Paris, 1921. Address: Radio Building, Bureau of Standards, Washington, D.C.

Ballantine, Stuart.—B. September 22nd, 1897, Philadelphia, Pa. Educ. Philadelphia Public Schools, studied mathematics at Drexel Institute. Engaged in electro-chemical research. H. K. Mulford Company, 1916; and telephone engineer, Bell Telephone Company, 1916-17. Took up development of radio compass for U.S. Navy Department, and was in charge of this work from 1917-20. At present pursuing special studies in mathematical physics at Harvard University. Address: 15, Sumner Road, Cambridge, Mass., U.S.A.

Bangay, Raymond D.—B. Lyme Regis, 1883. Educ. Epsom College and Finsbury Technical College. Joined the Marconi Company, 1902. Spent five years in America, during which time was engaged in different branches of the Service. Returned to England and studied Military Wireless Stations. Chief of the Field Station Department, Marconi's Wireless Telegraph Co., Ltd., 1914. Chief of Designs Department, of the same company, 1921. Author of "The Elementary Principles of Wireless Telegraphy" and "The Oscillation Valve." Address: Gresham Cottage, Brentwood, Essex.

Bardeloni, Colonel C.—B. in Brescia, 1871. Graduated from the Milan Polytechnic in Civil Engineering (1884), and in electrotechnic from the Turin Polytechnic (1901). Commendatore della Corona d'Italia and Cavaliere dei S.S. Maurizio e Lazzaro. Ufficiale della Légion d'Honneur. Received decorations of bronze medal, Italian and French war cross, etc. Organiser of the first wireless telephone experiments in the Italian Army and of radiotelegraphy for airships (1910). Instructor of wireless telegraphy at the W.I. Military Institute in Rome (1911-1916). Attached to the Headquarters from 1917 to the end of the war for the direction of wireless telegraph services. At present Director of the Army Wireless Telegraph Services. Member of the London International Wireless Telegraph Conference (1912); of the International Time Signals Conference in Paris (1913); of the Paris Inter-Allied Commission during the war; of the electric communications Inter-Allied Conference (1920); and of International Radiotechnic Committee in Paris (1921).

Baume, J. De la.—Began wireless career as midshipman of the French Navy in 1901, and was in the radio service of the North Squadron and 2nd Naval Division (Brest) in succession. In 1906 transferred to the Merchant Service and acted as Instructor of Radiotelegraphy to the personnel of merchant ships. In 1914 mobilised and attached to various radio services of the Navy and Military connected with the port of Toulon. In 1915 became Member of the Marine Nationale, Commission d'Etudes Pratiques de T.S.F. Toulon-Mourillon. Address: Commission d'Etudes Pratiques de T.S.F. Toulon-Mourillon.

Beggerow, Dr. Hans.—B. 1874. Educ. University of Berlin and Freiburg-in-Breisgau, where he obtained his Doctorate. From 1901 till 1919 chief expert adviser to the German Admiralty in all matters concerning wireless telegraphy. Similar position in the Prussian Army, 1906-14. Delegate of the Imperial German Government to the three International Radio Conferences of 1903, 1906, and 1912. Retired November, 1919. Occupied with private scientific work only. Member Deutsche Gesellschaft, 1914. Berlin - Wilhelmstrasse. Deutsche Physikalische Gesellschaft. Address: Berlin, W.15, Meierottostr. 3.

Bellini, Dr. Ettore.—B. Foligno, Italy, April 19th, 1876. Educ. Naples University. Electrical Engineer to the Royal Italian Navy, 1901. Chief of the Naval Electrical Laboratory at Venice, 1906. Responsible for carrying out research work dealing with the employment of wireless telegraphy on warships and submarines. Joint inventor with Capt. Tosi, of the Radiogoniometer.

Bethenod, J. F. J.—B. Lyons, 1883. Educ. Central School of that city. For a number of years acted as the Assistant of Professor André Blondel. From 1903 onward, published a large

number of theoretical articles on Electro-Dynamic Machinery, and has entered into business relationship with a number of Constructional Engineering Houses for the exploitation of his inventions. After a term of military service in the Engineers, specialised in wireless telegraphy. In this field, both scientific investigation and industrial practice owe several important contributions to his activities. Of recent years his attention has been turned to high frequency alternators, and he has built machines giving remarkable results. Consulting Engineer to the French Société Radio-Électrique.

Bhering, Francisco.—B. Uberaba, State of Minas Geraes, Brazil, January 1st, 1867. Under his initiation and supervision survey and mapping of Brazil undertaken in unified maps on the scale of one millimetre per kilometre. Represented Brazil as delegate at the International Telegraphic Conference of 1903, at the Radiotelegraphic Conference, London, in 1912, and at the Time Conference, 1912. Member of the mixed Civil and Military Commission organised to deal with wireless matters. Professor of Geodesy and Astronomy in the Polytechnic School of Rio de Janeiro. Director of the Technical Branch of the Telegraphic Administration. Author of a number of works on civil engineering, geography, and telegraphy. Address; Rua Conde Irajá No. 111, Rio de Janeiro, Brazil.

Binyon, Major Basil, O.B.E., M.A.—B. Ipswich, April 23rd, 1885. Educ. Leighton Park, Reading; Trinity College, Cambridge. Natural Science Tripos, 1907, and post graduate course Electrical Engineering. Appointed engineer to Cie. Generale Radiotelegraphique of Paris, 1911. Appointed General Manager Anglo-French Wireless Co. Granted commission in R.N.A.S., 1914. Appointed Officer-in-Charge Wireless Experimental Department of R.N.A.S., 1916. Promoted Squadron Commander, 1917. Awarded O.B.E. (military), 1918. Appointed Major R.A.F. M.I.R.E. Managing Director Radio Communication Company, Ltd. Director of C. F. Elwell, Ltd., Mullard Radio Valve Co., and Radio Press. Vice-Chairman, Radio Society of Great Britain. Address: 34, Norfolk Street, Strand, W.C.2; "Hawthorndene," Hayes, Kent.

Bion, Capitaine de Corvette.—B. Gazeran (Seine-et-Oise) 1881, and has studied in Paris at College Hanisler. Entered l'Ecole Navale 1899, and took a course at l'Ecole Supérieure d'Électricité de Paris. Prof. of Electrotechniques at l'Ecole Navale 1912-1914. Director of the second Naval Zone of T.S.F. (between Gulf of Gascoyne and the Channel), from 1914-1917. In charge of various radiotelegraphic missions between the Allies. Director of Scientific Research of the naval staff. Member of la Société Française de Electriciens, Française de Physique, des Amis de la T.S.F., The Institute of Radio Engineers, and la Société des Agriculteurs de France. Officer of the Legion of Honour, K. of the British Empire. Address: Chateau de Gazeran (Seine-et-Oise) France.

Bjarnov, Alexander William.—B. Copenhagen, 1874. Studied Polytechnic Academy, Copenhagen. Attached to the Telegraph Dept. since 1903. Passed through the Naval and Torpedo Department Spark Telegraph School for Officers in 1907. Since 1909, together with Helmuth Schledermann, has supervised the examination of wireless operators and the inspection of wireless stations on board ships flying the Danish flag. Engineer-in-Chief of the Danish Telegraph

Dept., Third Engineering District; Fellow of Danish Engineers' Association and of the Electro-technic Association (Elektroteknisk Forening); member of the Board from 1911 to 1919; Associate of the American Scandinavian Foundation. Address: Gl. Kongevej 96, Copenhagen V.

Bjoerkman, S. O. V.—B. 1883. Since 1911 Superintendent of the Wireless Stations at Nya Varvet, near Gothenburg, Sweden. Address: Nordhemsgatan 33, Gothenburg.

Blandy, Col. Lyster Fettiplace, D.S.O., R.E.—B. September 21st, 1874. Educ. Haileybury College and Royal Military Academy, Woolwich, Entered Royal Engineers, March, 1895; Captain, 1904; Major, 1914; Brevet Lieut.-Col., 1917; Col., R.A.F., 1919; Lieut.-Col., R.E., 1921. From 1908-12, Inspector Royal Engineers Stores at Woolwich, during which period had much to do with Army Field Wireless Sets. In the beginning of 1913 commanded the Wireless Signal Company at Aldershot. From 1914-17 in charge of Wireless Communication of the B.E.F., France. Became Chief Experimental Officer of Army Signals Experimental Establishment, July, 1917. Chief Experimental Officer, R.A.F., April, 1918, and thence transferred Controller of Communications of the Air Ministry; Head of the British Delegation to the International Technical Committee on Radio-Communication, Paris, 1921; Officer of the Legion of Honour; Chevalier of the Order of the Crown of Belgium; Mons Star with bar; General Service and Victory Medals; Croix de Guerre of Belgium. Address: Naval and Military Club, London.

Blondel, André E.—B. Chaumont, France, 1863. Graduated at Paris University. Contributor to learned societies and technical journals on several subjects, including wireless telegraphy. Invented (1893) a new apparatus, which is known as the "Oscillograph," and which opened a fresh field for the study of alternating currents. Was the first to explain, mathematically (1893), the effect of inertia in the hunting of alternators. Among his other activities in wireless telegraph, mention should be made of directed waves produced by a double aerial oscillating on the fifth harmonic, and also of a system of acoustically syntonic wireless telegraphy.

Blondlot, Professor Prosper René.—B. Nancy, 1849. After completing his scientific studies in Paris, returned to Nancy. Became Professor at the Faculty of Sciences. Now Hon. Professor and Correspondent of the Institute of France. Devoted considerable study to the problem of electromagnetic waves, the main object of his researches being to determine the speed of propagation of such waves. In 1891 he found for this speed the value 302,200 km. per second, and, in 1893, by another and quite different method, the value 297,200 km. per second. Has also investigated the laws of propagation of wireless waves in various media.

Bouthillon, Léon.—B. 1884. Pupil of l'Ecole Polytechnique (Paris) from 1903-1905. Apprenticed to the Engineering Dept. of the Posts and Telegraphs. Engineer of Posts and Telegraphs in 1908, and was attached to the service of la Télégraphie Sans Fil. In 1911 was nominated Director of Service de T.S.F. de l'Administration des Postes et Télégraphes. Completed the network of coast stations and established them on a sound basis. He represented France as delegate at the radiotelegraphic conference in London, 1912. In 1920 was nominated Engineer-in-Chief of Posts and Telegraphs. Left

the administration of Posts and Telegraphs for private industry. Was General Inspector of Exploitations of La Compagnie Générale de T.S.F. of the affiliated companies and associations. Was Prof. of T.S.F. at l'Ecole Professionnelle Supérieure des Postes et Télégraphes. From 1913-1920 was engaged in various matters of conferences in l'Ecole Supérieure d'Électricité, Paris. He was organizer of l'Administration Française, then the Grandes Compagnies and Associations des Ecoles de T.S.F. Has been Instructor of Physics at l'Ecole Polytechnique in Paris since 1913. Has published a number of technical and scientific articles on radio-communications. He has written, in collaboration with G. E. Pétit, a work entitled "La Télégraphie sans Fil." He is also the author of an important treatise in 8 volumes entitled "La Théorie et la Pratique des Radiocommunications." The Academy of Sciences at Vienna in 1920, the Herbert Prize for works relating to T.S.F. Address: Ingénieur des Télégraphes, Bureau du Service Central de la T.S.F., 25, Rue Boissnadé, Paris.

Boys, Charles Vernon, F.R.S.—Educ. Marlborough, Royal School of Mines, Gas Referee. Author of "Soap Bubbles" and of numerous papers published by the Royal Society and others. Edited and compiled "Dynamometers" by the late F. J. Jervis-Smith. Officier de l'Instruction Publique (France); Hon. Member New York Academy of Sciences; also of Physical Society, Moscow; Past President, Physical Society of London and Röntgen Society. Addresses: St. Marybourne, Andover, Athensum and Royal Automobile Clubs, and 66, Victoria Street, S.W.1.

Bradfield, William Walter, C.B.E.—B. London, 1879. Entered the Wireless Telegraph & Signal Co., Ltd., 1897. Electrical assistant to Senatore Marconi all through the course of the latter's experimental work in Radiotelegraphy on Salisbury Plain during 1897. Installed the first wireless apparatus on British battleships, 1899, and a little later assisted in demonstrations to the United States Government on board the United States battleship "Massachusetts." In 1901 similar demonstrations conducted by him for the French Government resulted in the establishment of wireless communication between the French Riviera and Corsica. Supervised in 1901 the erection of the station at Siasconset and the Nantucket Lightship. Chief Engineer to the Marconi Wireless Telegraph Co. of America, 1902. Deputy Manager of Marconi's Wireless Telegraph Company, and of the Marconi International Marine Communication Co., Ltd. Manager of both concerns, 1910. Elected to the Board of the two companies, 1917. Joint General Manager Marconi's Wireless Telegraph Company, Ltd., and Marconi International Marine Communication Company, Ltd. Address: 1, St. James's Place, London, S.W.

Brailard, Raymond.—B. 1888, Dept. of Jura, France. Studied engineering at the Ecole des Arts et Métiers, Cluny, and Ecole Supérieure d'Électricité, Paris, 1907. Two years in the electrical industry. Military service at the Eiffel Tower Wireless Station, 1910. Engineer of the Société Française Radio-Électrique, 1911. Visited Belgian Congo as Chief Engineer of Wireless Telegraphy and installed the network of Congolese Station, 1911-12. Installed the station at Laeken, near Brussels. Secretary of the International Commission on Scientific Wireless Telegraphy, 1913-14. During the war attached first to the Wireless Service of the Belgian Army, then to

the Wireless Station at Croix d'Hins (Bordeaux). Technical manager of the Société Indépendante de T.S.F., 1919. Author of several scientific papers. Technical Manager of the Société Indépendante Belge de Télégraphie sans fil and Consulting Engineer of the Belgian Congo Wireless Service. Address: 23, Boulevard de Waterloo, Bruxelles.

Branly, Edouard.—B. Amiens, October 23rd, 1844. Educ. St. Quentin College and Henry IV College, Paris. Fellow of the University, Doctor of Physical Science, and Doctor of Medicine. Some of his patents of 1890 and 1891 relate to the electrical conductivity of radio-conductors and to the operation of a local relay circuit from a distance. International Jury of Superior Precept Instruction awarded him (1900) *grand prix* for his exhibition of radio-conductors. French Minister of Public Instruction made him an Officer of the Legion of Honour in recognition of the part he had played in connection with the discovery of "Wireless Telegraphy." Has constructed various independent distributing apparatus for producing tele-mechanical effects without wires. Elected a member of the Academy of Science, Paris, January, 1911. Address: 21, Avenue de Courville, Paris.

Bredow, Hans, Doctor.—B. 1879. Entered the service of the Telefunken Co., as an engineer in 1904, and took over the management jointly with Count Arco in 1908. Joint founder of a number of wireless companies namely: Australasian Wireless, Ltd., Sydney (1909); Deutsche Betriebsgesellschaft für drahtlose Telegraphie (Debeg), Berlin (1911); Atlantic Communication Co., New York (1911); Deutsche Sudan-Gesellschaft für drahtlose Telegraphie, Berlin (1912); Société Anonyme Internationale de Télégraphie sans fil Brussels (1913); Amalgamated Wireless Australasia, Ltd., Sydney (1913); Drahtloser Urbersee-Verkehr A.G. (Transradio), Berlin (1913). In 1919 he entered the service of the State and now directs as Secretary of State the Telegraph, Telephone and Wireless service of Germany.

Brenot, Commandant Paul.—B. Ruoms, Ardèche, September 19th, 1880. Educ. Ecole Polytechnique. Transferred to the Central Establishment of Radiotelegraphy. Represented wireless telegraphy at the International Electrical Congress at Marseille, 1908, and later on collaborated with M. Blondel in various investigations into radiogoniometry and high tension arcs for wireless telegraphy and telephony. Carried through some important experiments on the employment of wireless telegraphy in aircraft, 1910-11, which gained him the Cross of the Legion of Honour. Technical adviser to the Minister of the Colonies, 1911. Delegate of the Colonial Office at the International Radiotelegraphic Conference, London, 1912; at the International Time Conference, Paris, 1912-13; and at the International Safety-at-Sea Conference, London, 1913-14. During the war, whilst remaining in charge of French Colonial wireless, appointed head of the Radiotelegraphic Centre at Paris and of the Eiffel Tower Station. Left Army, 1919. Became Technical Manager of the Société Française Radio-Électrique and of the Compagnie Générale de Télégraphie sans Fil. Address: Cie. Générale de T.S.F., 79, Bvd. Haussmann, Paris (8e).

Bright, Sir Charles, F.R.S.E.—B. London, 1863. Educ. Lancing College and King's College. Engineer and Electrician for the construction, testing, laying and repairing of over 25,000 miles of submarine cable. Principal of Sir Charles

Bright & Partners, Consulting Engineers, 146, Bishopsgate, E.C.2. Gave special expert evidence before Inter-Departmental Cables Communication Committee (1902), House of Commons Radiotelegraphic Committee (1907), and Dominions Royal Commission (1911). Member of R.F.C. (Air) Enquiry Committee (1916), and of British Association War and Engineering Committee (1916). Official delegate at Air Conference (1920 and 1922). Contributed papers, addresses and lectures to numerous learned societies technical journals and reviews. Author of "Submarine Telegraphs," "The Story of the Atlantic Cable," "The Administration of Imperial Telegraphs" and "Telegraphy, Aeronautics and War." Represented Australia as sole delegate at the International Radiotelegraphic Conference (1912). Vice-President, Radio Society of Great Britain and Institute of Aeronautical Engineers. Addresses: Leigh Grange, Tonbridge, and Athenæum Club, Pall Mall, London, S.W.1.

Brillouin, Léon Nicolas.—B. 1889 at Sevres (Seine-et-Oise). Pupil of L'Ecole Normale Supérieure (1909-1913). Licentiate of Mathematics and Physics. Fellow in Physics and Chemistry (1913). Sub-lieutenant of the 8th Engineers of l'Etablissement Central de Radiotélégraphie (1914-1919). Prof. of l'Ecole Supérieure de T.S.F. Doctor of Science (1920). Engineer of the Société Indépendante de T.S.F., Paris. General Secretary of "Journal de Physique," Paris. Address: 30, Quai du Louvre, Paris I.

Brown, Frank James, C.B., C.B.E., M.A., B.Sc.—B. 1865, near York. Educ. privately. Grad. London University (Honours and Prizeman). Entered the Higher Division of the Civil Service, 1886. Appointed to the Post Office. Principal Clerk, 1910. Assistant Secretary in charge of Telegraphs, March, 1919. Member of British Peace Delegation, 1919, in capacity of expert adviser on telegraph questions. Post Office representative on Imperial Communications Committee, and Member of Wireless Telegraph Sub-Committee of that Committee. Member of Imperial Wireless Telegraphy Committee appointed by Government in 1919 to formulate a scheme of W/T for the Empire. Senior British Delegate to Conference at Washington on Telegraph Communications, 1920. Expert adviser on Telegraph questions at Arms Conference, Washington, 1921-22. Commander of the Dannebrog. Address: G.P.O., London.

Brown, Sidney George, F.R.S.—B. 1873, Chicago, U.S.A., of English parents, and brought to England when eighteen months old. Educ. Harrogate and London University. Made a special study of submarine telegraphy and is inventor of the magnifying cable relay. Invented the drum cable relay and the magnetic shunt, 1898. Since that date he has also devoted much attention to telephony and wireless telegraphy and has achieved some important results, such as the carbon telephone relay telephone transmission on land trunk lines, the improved wireless telephone receiver, and other inventions. Vice-President of the Radio Society of Great Britain.

Bucher, Elmer E.—B. Akron, Ohio, November 11th, 1885. Educ. Academy Oberlin, Ohio. Joined the De Forest Wireless Telegraph Company as experimental engineer, 1903. Constructed several high-power stations in the Middle West and on the Gulf Coast for this firm. Joined the United Wireless Telegraph Company as installation and experimental engineer, 1907. Installed the first ship stations

of the United States Navy. Organised the United Wireless Telegraph Company's School, 1909. Instructing engineer and chief inspector of that company for more than two years. Associated himself with the Y.M.C.A., New York, in the initiation of wireless schools, 1910. Joined the Marconi Wireless Telegraph Company of America as instructing engineer, 1912. Organised Marconi Institute, 1917, and acted in capacity of Director. Joined Commercial Department, Radio Corporation of America, 1920. Held position as Technical Editor of "Wireless Age" during the period 1913-18. Author of "Practical Wireless Telegraphy," "Vacuum Tubes in Wireless Communication," "Wireless Experimenters' Manual," and other works. Member of the Institute of Radio Engineers.

Bullard, Rear-Admiral W. H. G., U.S.N.—B. December 6th, 1866, State of Pennsylvania, U.S.A. Graduated, United States Naval Academy, 1886. Served on ships of the Navy on the Atlantic, South Atlantic, Pacific and Asiatic Stations, with shore duty, with particular reference to the science of Electrical Engineering, in which he had specialised. First Superintendent of the Naval Radio Service, 1912-16. Delegate-plenipotentiary of the United States at the International Conference for Safety of Life at Sea, London, November, 1913. In charge, on behalf of the United States Navy, of the wireless operations contained in the series of experiments carried out between the Eiffel Tower and Arlington to determine longitude by means of wireless telegraphy. During the War his sea service was in the Sixth Battle Squadron of the British Grand Fleet, serving in the North Sea. After the war he returned to Washington in charge of the Communication Service of the Navy Department, with the title "Director Naval Communications," the former Radio Service having been enlarged to include all forms of communication.

Burstyn, Dr. W.—B. Austria, 1877. Educ. Vienna University. Started his career as electrical engineer with the Siemens-Schuckert Werke, Charlottenburg. Later engineer with Gesellschaft für Drahtlose Telegraphie and others. Wireless engineer with the Russian navy in the Russo-Japan war. Developed together with Baron Lepel (1907-12) the quenched spark system. Proprietor of a Techno-Physical Laboratory. Late *privat-docent* for wireless telegraphy and electric clinics. Technical High School, Charlottenburg. Now Chief Engineer with the Allg. Els. Ges. Berlin. Many publications, especially regarding Wireless and electric switching, in "Jahrbuch für drahtl. Tel." etc., and other papers. Address: Berlin—Wilmsdorf, Prinzregentenstrasse, 23.

Carpentier, Jules.—B. Paris, 1851. Joined Ecole Polytechnique, 1871. Commenced work with the State Railways. In 1876 appointed Principal Stores Engineer of Lyons Railway Company. For his electrical work shown at the Electrical Exhibition of 1881, he obtained the Gold Medal and the Cross of Chevalier of the Legion of Honour. Later became President of several learned Societies. Entered the Bureau des Longitudes, 1897. Interested himself from the beginning in radiotelegraphy. Founder of the Compagnie Générale Radiotélégraphique, which was later absorbed by the Compagnie Générale de Télégraphie sans Fil. Member of the Académie des Sciences, Bureau des Longitudes, Commander of the Legion of Honour, President of the Société de Publications Radiotechniques.

Chaffee, Professor E. L.—B. April 15th, 1885, Somerville, Mass. Educ. High School, Somerville, and Massachusetts Institute of Technology in Boston. Graduated B.S. in Electrical Engineering, 1907. Awarded the degree of M.A. in Physics, Harvard University, 1908, and Ph.D., 1911. Conducted courses in physics and radiotelegraphy at Harvard University. Engaged in research and consultation work in radiotelegraphy, Assistant Professor of Physics, Harvard University. Author of several papers, including "A New Method of Impact Excitation of Electric Oscillations and their Analysis by the Braun Tube Oscillograph," published 1911. Physical Laboratory Manual, paper on "Electrical Response of the Retina to Stimulation by Light," "Regeneration in Coupled Circuits," etc. Fellow Academy of Arts and Sciences (Amer.), Fellow and Vice-Pres. I.R.E. (Amer.), Member Physical Soc. (Amer.), Member Optical Soc. (Amer.). Research Fellow of Cancer Commission, Harvard Univ. Address: Cruft, H. T., Elect. Laboratory, Harvard University, Cambridge, Mass.

Chamberlain, Eugene Tyler.—Son of General Frank Chamberlain. B. in Albany, N.Y., September 28th, 1856. Educ. Albany Academy and Harvard College. Graduated with honours in Metaphysics, 1878. In business for two years, then took up journalism and acted as legislative and political correspondent to the Associated Press. Came to Washington, 1893. Appointed Commissioner of Navigation by President Cleveland. In 1903, on the creation of the Department of Commerce and Labour, he joined others in urging the importance of wireless telegraphy as a means of promoting safety of life on merchant vessels at sea, and he has since played a prominent part in promoting legislation on this subject. Delegate for the U.S.A. to the Convention on Safety of Life at Sea, at London, 1914. Address: Department of Commerce, Bureau Navigation, Washington, D.C.

Childs, H. B. T.—B. Llandilo, S. Wales, 1884. Educ. King's School, Canterbury; London University. Joined the Marconi Company, 1905. Served as Engineer in Russia, Canada, Spain, and Egypt. Joined Royal Flying Corps, autumn, 1915. Served in France, November, 1915, to August, 1917. Appointed to command W/T Experimental Establishment, R.A.F., August, 1917. Promoted Lieut.-Col., December, 1917. Appointed in charge of W/T for the R.A.F. in France, May, 1918, till April, 1919. Mentioned in despatches, 1916, 1918. Chief of Field and Air Division, Marconi's Wireless Telegraph Co., Ltd. Address: Holdenhurst, Otlands Avenue, Weybridge.

Chevrelière, Jean Marie Charles Aymé, Baron de la.—B. Poitiers, France, 1858. Educ. in that city. Member of Parliament, Mayor and General Counsellor. After a course at the Military Academy of St. Cyr (1877-79), followed by specialised training at Saumur, remained for fifteen years in the active army as cavalry officer, retiring with the grade of captain in the Reserve, 1892. Member of Légion d'Honneur, Military class. Mobilised from August 2nd, 1914, to July 5th, 1917. Joined the Board of the Belgian "Société Anonyme de T.S.F.," 1901, and subsequently took a prominent part in the initiation of the "Compagnie Française Maritime et Coloniale de T.S.F.," now known as "Compagnie Industrielle de Mécanique et d'Electricité," of which he is President and Managing Director. From early 1914 to the end of January, 1918, occupied the post of managing director of the Cie Universelle de

Télégraphie et de Téléphonie sans Fil, which on February 12th of the same year was merged in the Cie. Générale de T.S.F., of which he is vice-president. Director of "Société Française Radioélectrique" and Vice-President of Cie. Radio Maritime. Also Director of "Cie. Radio France" and of "Cie. Sté. Franco Argentine." Address: 23, rue Dumont d'Urville, Paris. The Jockey Club and Nouveau Cercle.

Chree, Charles, F.R.S.—B. 1860, Linlathen, Forfarshire, Sc.D. of Cambridge, Hon. LL.D. (Aberdeen). Graduated M.A. Aberdeen (1879) with first-class honours in Mathematics and Natural Philosophy. At Cambridge, in 1883, was sixth wrangler, gaining also first-class honours in Mathematical and Natural Sciences Triposes. Fellow of King's College, Cambridge (1885); re-elected Research Fellow (1891), ex-President of Physical Society of London; Pres. Royal Meteorological Society. Pres. Section of Terrestrial Magnetism and Electricity, International Union of Geodesy and Geophysics. Obtained Watt Medal of Institution of Civil Engineers. Largely concerned with geophysics, especially terrestrial magnetism and atmospheric electricity. For his researches in the former subject received Hughes Medal from the Royal Society. Publications: "Studies in Terrestrial Magnetism," articles in "Encyclopædia Britannica." Address: 75, Church Road, Richmond, Surrey.

Cohen, Louis, Ph.D.—B. 1876. Educ. at Armour Institute of Technology, University of Chicago, and Columbia University. On scientific staff of the Bureau of Standards, 1905-09. Chief of Research Department of the National Electric Signalling Co., 1910-12. Engaged in consulting practice since 1912. Professor of Electrical Engineering, George Washington University. Especially interested in the subject of electrical oscillations. Author of "Formulae and Tables for the Calculation of Alternating Current Problems," and scientific and technical papers dealing with problems in wireless telegraphy and kindred subjects.

Coursey, Philip R., B.Sc. (Eng.)—B. 1892. Educ. University College, London. Awarded Diploma in Electrical Engineering with Distinction. Graduated with first-class Honours in Electrical Engineering at the University of London. Subsequently acted as Assistant to Dr. J. A. Fleming, F.R.S., in the Electrical Engineering Department and Research Laboratories of University College, London. From 1915-18 served as Inspector of Wireless Telegraph Apparatus for the Admiralty; afterwards appointed to the staff of H.M. Signal School, Portsmouth, as Research Physicist. Sometime Research Electrical Engineer, now Chief Engineer, to the Dubilier Condenser (1921) Co., Ltd. Author of papers on Radiotelegraphy and Telephony, read before a number of Societies, and of "Telephony without Wires." Address: 138, Muswell Hill Road, London, N.10.

Craioveanu, Eugen.—B. 1872. Secondary studies and graduated in Physics and Chemical Science in Roumania. Sent by Roumanian Post Office Department to study as Telegraph Engineer at Ecole Supérieure des Postes et Télégraphes, Paris, and Post und Telegraphen Hochschule, Berlin. Engineer in all branches of Telegraphy and Telephony, Roumanian Post Office. District Director, Chief of Telegraph Postal Service during Balkan War (1913), and also 1916 to 1917. Sub-Director-General of Roumanian Posts, Telegraphs and Telephones, January, 1920. Resigned August 1st, 1920. Engaged in research for modernising technical

telegraphy and telephony. Director-General of Roumanian "Radioromăna" Company, formed by the fusion of the Roumanian "Marconi" and "Radioelectrică" Companies. Address: 4, Strada Saguna, Bucarest-Roumania.

Craven, Tunis A. M.—B. 1893. Graduate U.S. Naval Academy Class of 1913. Radio Officer U.S.S. "Delaware" 1913-1915. Fleet Radio Officer U.S. Asiatic Fleet 1915-1917. In charge U.S. Naval Coastal and Transoceanic Radio Operations, 1917-1920. U.S. Naval Representative at Provisional Inter-Allied Communication Conference at Paris, France, in 1919. Naval Representative on U.S. Government Inter-Departmental Board to arrange for collection and distribution of meteorological data in 1919. U.S. Naval Radio Technical advisor at International Conference on electrical communication at Washington, 1920; was also chairman of sub-committee on wavelength allocation at this Conference. Battleship Force Radio Officer 1921. U.S. Naval Representative at Conference of Committee on International Radio Communication at Paris, France, in 1921. Fleet Radio Officer U.S. Atlantic Fleet, 1921-1922. Lieutenant U.S. Navy (Radio Traffic Engineer).

Crawley, Lieut.-Col. C. G. G., R.M.A. (Ret.).—B. 1880. Educated Dublin University and R.N. College, Greenwich. Employed at Wireless Telegraphy in the Navy, 1903 to 1913, as Experimental, Instructional, and Fleet Wireless Officer. Deputy Inspector of Wireless Telegraphy in the Post Office, 1913. Returned to the Naval Wireless service for the period of the war. Served in the Grand Fleet, in command of the R.N.V.R. Wireless School, at the Admiralty, and supervised the erection and working of various Naval stations abroad. Officer of the Order of Aviz. Order of Liakat. R.H.S. testimonial for-saving life. Resumed his duties in 1919. Sec. to the Wireless Telegraphy Commission for planning stations for the Imperial Chain. Deputy Inspector of Wireless Telegraphy, General Post Office. Address: General Post Office, London, E.C.

Cresswell, F. G.—Entered upon professional career, 1897, and received his training and experience with engineering firms in Australia. Entered Government service in the Electrical Engineers' Branch of the Postmaster-General's Department, Melbourne. Commissioned in the Naval Forces of the Commonwealth as Engineer Sub-Lieutenant detailed for electrical duties, 1907. Served in the Royal Australian Navy from the time of its inauguration. Appointed Fleet Wireless Telegraph Officer, 1912, rising to the rank of Radio Commander and Acting Director of the Radio Service, July, 1916. Selected to take over the control, under the Naval Board, of the Wireless Telegraphy Department of the Commonwealth, which had been transferred by Act of Parliament to the control of the Royal Australian Navy. Assisted at the capture of the German high-power wireless stations at Samoa, Nauva, and Rabaul, being mentioned in despatches. Member of the Institute of Engineers, Australia. Appointed Electrical Lieut.-Commander Royal Australian Navy since the transfer of the Commonwealth Radio Service back to the Postmaster-General's Department and the disbandment of the Royal Australian Naval Radio Service. Director of Signal Division Naval Staff. Address: Navy Office, Melbourne.

Cross, Professor Charles R.—B. at Troy, New York, March 29th, 1848. Returned with his father to Newbury Port, Massachusetts, 1862. Graduated at the Putnam Free School in that

city, 1865, and engaged temporarily in teaching. Graduated at Massachusetts Institute of Technology, 1870. Appointed instructor in Physics. Became a Junior Professor in Physics, 1875. Placed in charge of the Dept. of Physics, 1877, and later Thayer Professor of Physics and Director of the Rogen Laboratory of Physics. Became interested in the industrial applications of electricity. Lectured upon this subject, 1881. Retired from active teaching, 1918, and made Professor Emeritus. Author of papers embodying the results of researches upon electric and acoustic subjects. Has delivered many public lectures, a number of which were before the Lowell Institute of Boston. Acted as expert for the American Bell Telephone Company throughout the extended litigation concerning the Bell patents, as well as in other telephone cases. Expert for the American Marconi Company in the suits which resulted in the establishment of its fundamental patents. Fellow of the American Academy of Arts and Sciences. Chairman of the Rumford Committee of that institution for twenty-two years. President of the Elizabeth Thompson Science Fund, a member of the American Association for the Advancement of Science, the British Association for the Advancement of Science, and of the American Institute of Electrical Engineers, of which he was one of the original vice-presidents. Past Chairman of one of the three Lectures of the Electrical Congress at the World's Columbian Exhibition at Chicago, 1893.

De Forest, Dr. Lee.—B. Council Bluffs, Iowa, 1873. Graduated Ph.D. 1899. Founded the De Forest Wireless Telegraph Co. 1902, the Radio Telephone Co., and the De Forest Radio Telephone Co., 1907. In 1904 was working on the use of the flame as a rectifier for high frequency radio currents and took out a patent, from which, in 1907, he evolved the Audion by interposing a grid into the two electrode valve. Awarded Gold Medal for radiotelegraphic work, St. Louis Exhibition 1904. M.I.E.E. (Amer.) Member Franklin Institute M.I.R.E. (Amer.). Address: The De Forest Radio Telephone & Telegraph Co., Central Avenue, Jersey City, N.J.

De Groot, Doctor Engineer Cornelis Johannes.—B. at Den Helder, January 27th, 1883. Educ. as Mechanical Engineer at Technical High School, Delft, and afterwards at Karlsruhe, where he obtained the diploma of Electrical Engineer. During 1915-19 took degree as Doctor in Technical Sciences at Delft University. Spent eighteen months in the service of the G.E.C. of Berlin, and thence transferred himself to the Dutch East Indian Government, superintending the erection of various wireless stations in the Indian Archipelago. In 1915-16 visited Europe on furlough and took Doctor's degree on the thesis of "Radio telegraphy in the Tropics." Chief of the Radiotelegraphic Service in the Dutch East Indies. Has made many contributions to radio literature, one of the best known being a monograph on "The Nature and Elimination of Strays," originally read before the Institute of Radio Engineers, New York.

Dellinger, J. H.—Born Cleveland, Ohio, 1866. Educ. East High School, Cleveland, Ohio; graduated 1903 Western Reserve University, Cleveland, Ohio; student 1903-07; Phi Beta Kappa, 1906; instructor in physics, 1906-07. George Washington University, Washington, D.C.; A.B. 1908. Princeton University; Fellow, 1912-13. Ph.D., 1913. Bureau of Standards, Board of Graduate In-

struction; instructor in electricity and radio, 1918-19. Physicist in Bureau of Standards, 1907 to date. Research on: electrical properties of copper (becoming the basis of international standard); miscellaneous mathematical and electrical subjects; electric units; science and development of radio communication. Chief of Radio Laboratory, Bureau of Standards. Author of three books on radio communication and numerous articles and treatises in above fields published by Government and in various electrical and physical periodicals. Delegate of Department of Commerce at 1921 Conference in Paris of Inter-Allied Technical Committee on Radio Communication. Member of Technical Staff of Conference on Limitation of Armament and Far Eastern Problems, Washington, 1921-22. Secretary of U.S. Government Inter-department Radio Committee, 1922. American Physical Society; Washington Academy of Sciences; The Federal Club; American Radio Relay League, Technical Advisory Committee; American Radio Association, Advisory Committee; American Geophysical Union, Section of Terrestrial Magnetism and Electricity; International Union of Scientific Radio Telegraphy, Technical Secretary of American Section.

Dennergy, Alfred.—B. Marckolsheim (Bas-Rhin) 1871. Former pupil of l'Ecole Polytechnique. Inspector General of Posts and Telegraphs. Director of l'Ecole Supérieure des Postes et Télégraphes. President of Technical Committee of Posts and Telegraphs, wireless telegraphy section. In summer 1904, Delegate of the French International Congress of Electricians at St. Louis (U.S.A.). Director of the Office of the Ministry of Posts and Telegraphs 1906 to 1909. Founded le Laboratoire de Recherches de l'Administration des Télégraphes et Téléphones. President of the Commission des Annales des Postes, Télégraphes et Téléphones. Decorated with the Distinguished Service Medal (U.S.A.) for services rendered to the American Expeditionary Corps during the Great War. Member of Conseil de Perfectionnement de l'Ecole Polytechnique. Commander of the Legion of Honour. Address: Ecole Supérieure des Postes et Télégraphes, 20, Rue Las Cases, Paris.

Desbarats, George Joseph, C.M.G., B.Sc.—B. Quebec, January 27th, 1861. Educ. Public Schools; Terrebonne College, Ecole Polytechnique, Montreal (honours and gold medal, 1879); Laval University (B.A.Sc., 1901). Engineer on construction of canals and other public works; assistant to late John Page, Chief Engineer of Canals; Inspector, Railway Construction, B.C., 1892-96; Engineer of Construction, Galops Canal, 1896-99; employed in hydraulic survey work; St. Lawrence River, three years; rebuilt and enlarged the Government shipyard, Sorel, Quebec, 1901; Acting Deputy Minister of Marine and Fisheries, Ottawa, 1908-09; Deputy Minister, 1909-10; Plenipotentiary for Canada at the Radiotelegraph Conference held at London, England, 1912. Member of the Canadian Society Civil Engineers, 1897; Councillor, 1907; Vice-President, 1909; Councillor, Ecole Polytechnique, 1909; Plenipotentiary for Canada to International Seaman's Conference, Genoa, 1920. Deputy Minister and Comptroller of the Canadian Naval Service since June, 1910. Address: Ottawa, Canada.

Destruge, Guillermo, Director-General of Telegraphs, Telephones and Wireless, Ecuador, February, 1898, to February, 1906, and from

March, 1912, in which capacity he is still serving. Established duplex telegraphic system and telephones in Quito, the capital, 1900. President of the Radiotelegraphic Commission of the Republic. The personnel of the Telegraphic and Telephonic service of Ecuador presented to him on August 10th, 1920 as an appreciation of his good work, an artistic and valuable inscribed gold tablet. Author of several scientific publications. Address: Apartado No. 59, Quito, Ecuador, South America.

De Valbreuze, R.—B. 4877. Engineer-electrician (Ecole Supérieure d'Electricité Paris, 1903).—Presented (1902) a memorandum to the French Ministry of War on the subject of undamped waves. Attached as Officer of Engineers to the Central Establishment of Military Telegraph Materiel. Left Army for industry. Published (1906) a work on wireless telegraphy. During the war was a Captain of Engineers attached to the Radiotelegraphic Centre in Paris. Sometime Vice-President of the Société Internationale des Electriciens. Now Vice-President of the Société des Amis de la T.S.F., M.I.R.E., Member several French Technical Societies. Chevalier of the Legion of Honour. Address: 72, rue Bossière, Paris (xv).

De Vasconcellos e Sa, Dr. Alexandre.—B. November 28th, 1872. Graduated as a Doctor of Medicine in the Medical School at Lisbon. Joined the Portuguese Navy, 1894, where he gained a reputation as a physician and surgeon. After the proclamation of the Portuguese Republic in 1910 interested himself in politics, and as a member of Parliament specialised in Colonial subjects. Served in the Barú Campaign, 1912. Chief Health Officer to the expedition sent to Cuamato when the Germans invaded Portuguese territory, 1913-15. His services won him the highest military distinction granted by the Portuguese Navy. On returning from the expedition to Angola was appointed Commissioner of the Portuguese Government to the Mozambique Company. Secretary of State to the Colonies, May 14th, 1918. In this capacity devoted considerable attention to the development of radiotelegraphy in the Portuguese colonies.

Dowsett, H. M.—B. London, 1879. Educated at the Central Foundation School, London; Ecole Internationale, Paris. Trained as an electrical engineer at Finsbury Technical College under Professors S. P. Thompson and John Perry. His early practical experience was obtained with the British Thomson-Houston Co., Bankside, at the St. Pancras Electricity Supply Station, King's Road, and with S. Z. de Ferranti, Ltd., Charterhouse Square. In April, 1899, he joined the engineering staff of the Wireless Telegraph & Signal Co., now known as Marconi's Wireless Telegraph Co., Ltd. He was associated with much of the early developmental work of this company, and after having erected stations and demonstrated wireless telegraphy ashore and afloat for commercial and war purposes in many parts of the world, was appointed in charge of the test rooms and drawing office at the Hall Street Works, Chelmsford, in August, 1908. In 1912 he was responsible for the layout and equipment of the testing laboratories of the New Street works, which was opened in June of that year, and has held the position of chief of the testing department from that date to the present time. He revised the "Handbook for Wireless Telegraphists," of J. C. Hawkhead, for the second edition published in 1915, and is

the author of "Wireless Telegraphy and Telephony: First Principles, Present Practice and Testing," published in 1920. Contributed to the *Radio Review* and "The Year Book of Wireless Telegraphy and Telephony," Address: Marconi Works, Chelmsford, Essex.

Dubilier, William.—B. July 25th, 1888, in the U.S.A. Educ. Cooper Technical Institute, New York City. President and Technical Director of the Dubilier Condenser and Radio Corporation, New York City. Technical Director of the Dubilier Condenser Co., Ltd., London. Owner of condenser patents, licenses of the Canadian General Electric Co., Ltd., Toronto, Dubilier Condenser and Radio Corporation, New York City, Dubilier Condenser Co., Ltd., London, The Telefunken Company, Berlin, etc. M.I.R.E. (Amer.), Radio Club of America, Progress Club of New York. Inventor of the Ducon mica condenser. Owner of over 200 radio patents, and applications for radio equipment. Address: Bronxville, New York.

Eccles, W. H., D.Sc., A.R.C.S., F.R.S.—B. Furness, Lancs., 1875. Entered the Royal College of Science, South Kensington, in 1894. Three years later was appointed demonstrator in the Physics Laboratory at the College, and in 1898 graduated at the London University with first-class honours in Physics. In 1899 he entered Mr. Marconi's laboratory at Chelmsford and spent a great part of his time in the investigation of electrical oscillations of air wires and in "jiggers." Devised a laboratory method for testing and classifying coherers, and results of a later study of coherers were presented as one of his D.Sc. theses. In 1901 was appointed Head of the department of mathematics and physics at the South-Western Polytechnic, Chelsea, and afterwards University Reader in Graphics at University College, London. Vice-President of the Institution of Electrical Engineers, of the Physical Society, and of the Institute of Physics; First Chairman of the Wireless Section of the Institution of Electrical Engineers; Honorary Secretary of the British Association Committee for Radiotelegraphic Investigation. Since 1916, Professor of Electrical Engineering at Finsbury Technical College, and now Dean of the College. Address: 2, Ryder Street, St. James's, S.W.1.

Echevarri, Capt. J. A. V.—B. 1897. Educated King's College School. Gazetted Sub-Lieut. R.N.V.R. January, 1916. Subsequently became Capt. R.A.F. 1918. Appointed Assistant to Head of Wireless Telegraphy Board 1920. British Delegate at International Conference on Electrical Communications, Washington, D.C., 1920, also at International Technical Committee on Radio Communications, Paris, 1921. Department of Controller of Communications, Air Ministry. Address: Junior Constitutional Club, W. 1., and 22, Crescent Road, Wimbledon, S.W. 20.

Eichorn, Gustav, Ph.D.—B. Düsseldorf (Germany), December 1st, 1867. Studied physics. After the sudden death of his father became managing director of the paternal paper-mills for ten years. Returned to the profession of his choice and continued his interrupted studies. After three years at Berlin, Munich, and Zurich, took the degree (Phil. Dr.) at the last-named University. Entered the wireless telegraph laboratory of Prof. Braun and Siemens and Halske, in Berlin. Appointed manager of their experimental stations on the Baltic, where for about eighteen months he conducted a number of investigations. Publications: *Drahtlose*

Telegraphie (Leipzig, 1904), *Wireless Telegraphy* (London, 1906), *Drahtloser Überseeverkehr* (Zürich, 1921). Collaborator of various technical journals. Returned to Zurich as the representative of the Telefunken Co., 1905, and launched the *Jahrbuch der drahtlosen Telegraphie und Telephonie*, 1907. Engaged in practical and theoretical work in wireless telegraphy and telephony. Address: Hauptpostfach 6123, Zurich, Switzerland.

Eisenstein (Aisenstein), S. M.—B. Kief, Russia, 1884. Educ. Kief University. Studied at the University of Berlin and the Charlottenburg Polytechnic. First turned his attention to wireless telegraphy in 1900. Obtained his preliminary wireless patent and established a private experimental laboratory in 1904. His work received the attention of the Military Authorities, who assisted him to conduct experiments on a large scale and erect certain experimental stations. The action, taken in consequence by the War Office, resulted in the realisation of the necessity for forming a wireless company. The new departure speedily justified itself, and in 1911 the original company coalesced with the Marconi Company and the reconstructed Russian Organisation, with Mr. Eisenstein as Director and Principal Technical Adviser, assumed responsibility for the development of Russian wireless. During the war, he was responsible for the erection of all high-power wireless stations in Russia and for communications with the Allies. In connection with his war services he was appointed Councilor of State of the Russian Empire in 1915 and Officer of the Legion of Honour in 1916. He is also Professor at the Moscow Higher Technical College, member and Vice-President of the Russian Society of Radio Engineers, member of the Russian Technical Society, and member of the Physico-Chemical Society. He is the author of a large number of scientific papers, read before various technical societies and Congresses.

Elwell, Cyril Frank—B. 1884. Son of Thomas Dudley Elwell; married 1909 to Ethel Pullan. Educated Port St. Model Public School, Sydney, Australia; Stanford University, California (B.A. and E.E.). Career: Chief Engineer Wireless Development Co., 1908; Federal Telegraph Co., 1909 to 1913, and Universal Radio Syndicate, London, 1913 to 1915. Managing Director of C. F. Elwell, Ltd., since 1915. Knight of Cross of the Crown of Italy, B.A., M.I.E.E., M. Am. I.E.E., M. Italian I.E.E., F.I., Radio E. Clubs: Royal Automobile and Engineers, London. Address: 12 Craven House, Kingsway, London.

Erskine-Murray, James, D.Sc., F.R.S.E.—B. Edinburgh, October 24th, 1868. After six years' study and research under the late Lord Kelvin at Glasgow University entered Trinity College, Cambridge, as a research student. Assistant Professor of Physics and Electrical Engineering in the Heriot-Watt College, Edinburgh, 1896-98. Appointed experimental assistant to Mr. Marconi, 1898. Lecturer and Demonstrator in Physics and Electrical Engineering at University College, Nottingham, 1900. Lecturer in Electrical Engineering at the George Coates Technical College, Paisley, 1905. Consulting work in radiotelegraphy, 1905. Lecturer on Radio-telegraphy at the Northampton Institute, London, 1907-11. Contributed papers

to numerous learned societies. Author of several works on wireless telegraphy. Partner in the firm of Clark, Forde, Taylor, and Erskine-Murray, consulting engineers, 1913-18. Joined the Royal Naval Volunteer Reserve, 1917, with rank of Lieut.-Commander. Served with the Royal Air Force in charge of the design of wireless instruments and of experimental work till May, 1922. Past President of Wireless Society of London. Now Experimental Engineer at H.M. Signal School, R.N. Barracks, Portsmouth. Club, Caledonian.

Ewen, Harry Alexander.—B. Aberdeen, 1877. Educ. Aberdeen Grammar School; Liverpool Institute. Received Engineering training at Heriot-Watt College. Medallist in Elec. Eng. and Elec. Eng. Hons., 1901-02. Joined Engineering Staff of Marconi's W/T Co., 1902. Appointed Wireless Telegraph Expert to the Brazilian Navy, 1910; rejoined Marconi's W/T Co. as Chief of Drawing and Design Dept.; appointed Chief of Installation Design Division, 1922. Address: "Braeside," Priest Lane, Shenfield, Essex.

Faber, R. N. A., Lieutenant-Colonel, Royal Danish Engineers.—Born in Copenhagen, April 29th, 1869. Chief of Military Wireless Service of Denmark. Delegate to the International Radiotelegraphic Congress of Berlin, 1906, and London, 1912. Member of the Military Telegraph and Telephone Commission and of the Government Radiotelegraph Commission. Knight of the Order of Dannebrog, etc. Permanent address: Ingeniørkasernen, Copenhagen.

Farrand, C. L.—B. Newark, N.J., October 22nd, 1891. Educ. Central High School, Philadelphia, Pa. Wireless operator and instructor, 1909-13. Inspector of construction work, 1913, testing and designing of coastal stations. Assistant to Mr. H. Shoemaker, the research engineer of the Marconi Laboratory, Aldene, N.J. Engineer-designer to Aldene, N.J., 1917, especially devoting his attention to radiotelegraphic research and design.

Ferrie, General Gustave.—B. at St. Michel de Maurienne (Savoy), 1863. His connection with wireless telegraphy started February, 1899, when he was present during experiments of Senator Marconi between Wimereux and Dover. Initiated French Military Radiotelegraphic Service in 1900. Was member of French Delegation to the International Electrical Congress of St. Louis in 1904. Member of the French Delegation to the International Radiotelegraphic Conference of London (1912). Appointed General Secretary of the International Time Conference, Paris (1913). Member of the Inter-Allied Wireless Technical Committee in Washington (1920). President of the Inter-Allied Technical Committee in Paris (1921). President L'Union Radiotélégraphique Scientifique Internationale. President of the International Commission on Longitudes. Technical Director of French Military Radiotelegraphy. Member of the Academy of Science (Paris), D.Sc. (Oxford), Commander of the Legion of Honour, Companion of St. Michael and St. George, Grand Officer of the Eastern Sun (Japan), Commander of the Crown of Italy, Grand Officer of the Star of Roumania, Officer of the White Eagle of Serbia, Holder of the Distinguished Service Medal (U.S.A.), Commander of the Sword of Sweden, Commander of the Double Dragon of China, etc., etc. Author of the first work on wireless in France and a

large number of monographs and periodic contributions dealing with radiotelegraphy and kindred subjects, both from a technical and organisation point of view. Address: Inspecteur Générale de la Télégraphie Militaire, 51 bis, Bd Latour-Maubourg, Paris, 7e.

Fessenden, Reginald Aubrey.—B. Milton Canada, October 6th, 1866. Educ. New York and Port Hope, Ontario. Inspecting engineer to the Edison Company, New York. Took up teaching work and conducted classes in physics and electrical engineering at Western University, 1892. Professor of Electrical Engineering at Western University, Philadelphia, 1893. Special Agent to the U.S. Weather Bureau, 1900. Has devoted much attention to the development of a system of wireless telegraphy known by his name, and has also carried out important experiments in wireless telephony. Contributor of articles on wireless telegraphy and telephony to many technical journals.

Field, Rear-Admiral F. L., C.B., C.M.G.—B. April 19th, 1871. Entered Royal Navy, July, 1884; promoted Lieut., 1893; qualified as Torpedo Lieut., 1896. Landed in expedition for Relief of Legations at Pekin from H.M.S. "Bardie," 1900. Mentioned in despatches; wounded at taking of Tientsin Native City. Promoted Commander, 1902; Captain, 1907; Commanded H.M.S. "Duncan," 1910; Superintendent of Signal Schools, 1912; Capt. H.M.S. "Vernon" (Torpedo School), 1914; Capt. H.M.S. "King George V" at Battle of Jutland; mentioned in despatches, awarded C.B. (Military division). Chief of Staff to Admiral Second-in-Command Grand Fleet, 1916. Awarded C.M.G. for this service. Director of Torpedoes and Mining at Admiralty, 1918. Promoted Rear-Admiral, February 11th, 1919. Third Sea Lord and Controller of the Navy; Member of Committee (appointed November, 1919) to advise British Government on Imperial W/T Communications. Addresses: Admiralty, Whitehall, London, S.W.1, and United Services Club, Pall Mall.

Fisk, Ernest Thomas.—B. Sunbury-on-Thames, August 8th, 1886. Educ. Primary and High Schools. Studied physics, mathematics, and commercial subjects. After two years with Messrs. Frederick Walton and Co., he entered the British Telegraph Service. Joined the Marconi Company in England (1905). Temporarily engaged in engineering branch of the American Marconi Company, erecting stations on ship and shore. Undertook a special mission to the Arctic icefields, 1909, and demonstrated the possibilities of wireless communication with Newfoundland Sealing Fleet. Visited the Antipodes, 1910, in R.M.S. "Otranto," and demonstrated the use of the Marconi apparatus for the Orient Mail Line of steamers. Again visited Australia, 1911. General Manager with a seat on the board of directors of Amalgamated Wireless (Australasia), Limited, 1913. Revisited England, 1916. Shortly after return to Australia, accepted position as Managing Director of the Company. Tested possibility of direct wireless communication between England and Australia. Gave the first public demonstration of wireless telephony in Australia before the Royal Society of New South Wales. Managing Director of the Australactic Company, now Australactic, Limited. Founder and initiator of "Sea, Land, and Air," the first journal in the Southern Hemisphere to deal with aviation and wireless. Established the Australasian branch of The Wireless Press.

Member of the Electrical Association of Australia, President of the Wireless Institute of Australia (New South Wales Section), Member of the Sydney Chamber of Commerce and the Chamber of Manufacturers, Member of the Executive Committee, Australasian Industries Protection League, Member Provisional Committee appointed to consider the formation of the Chamber of Science and extending application of science to industry. Chairman Section of Industry, Royal Society of N.S.W., 1920-21. Contributed Paper entitled "The Thermionic Valve in Wireless Communication." Addresses: "Wireless House," Clarence Street, Sydney, N.S.W., "Wireless House," Chancery Lane, Melbourne, Vic., "Australia House," Strand, London, W.C.2.

Fleming, John Ambrose, D.Sc., M.A., F.R.S.—B. Lancaster, November 29th, 1849. Educ. University College School, London; University College; R. School of Mines. Sometime Fellow of St. John's College, Cambridge; Fellow and Hughes Gold Medallist, Royal Society. Lecturer in Mechanics and applied science, Cambridge University (1880). First Professor of Mathematics and Physics (1881), University College, Nottingham. First occupant of Pender Chair of Electrical Engineering, University College, London (1885); Vice-President of Radio Society of Great Britain. Sometime Vice-President of Institution of Electrical Engineers and Physical Society. Honorary Member of the Royal Engineers' Institute, Chatham. Scientific Adviser to the Edison and Swan United Electric Light Company, 1882-93. Scientific Adviser to the London Electric Supply Corporation, and many other corporations, firms and companies in electrical matters. Publications: Numerous contributions to scientific literature and research. Author of well-known text-books, particularly on wireless telegraphy. Twice awarded Institution Premium of Institution of Electrical Engineers; also twice awarded the silver medal of Royal Society of Arts, and Bernay's Premium of the Society of Engineers. Awarded the Gold Albert Medal of the Royal Society of Arts in 1921 for his electrical researches and inventions. Widely known as the inventor of the Thermionic Valve or Fleming Valve. University Professor of Electrical Engineering, University of London (1912). Address: The Pender Electrical Laboratory, University College, Gower Street, London, W.C.1.

Forberg, Olaf E.—B. November 22nd, 1871, in the Province of Finnmark, Norway. Early attached to the Norwegian Telegraphic Service, first as a Telegraphic Clerk, later as the head of a station; Manager of the Controlling Station Veblungnes, in the Romsdal, 1900. Erected several new telegraphic plants in Norway, 1893-1904. Went to Iceland on an inspection, 1905, and in 1906 he constructed the telegraphic line from Reykjavik to Seydisfjord. Superintended the erection of stations and organisation of the telegraphic system in Iceland. Director of Telegraphs in Iceland, 1907, and controls both the wired and wireless nexus of the island. Member of the Engineers' Association of Iceland. Knight of Dannebrog, 1907. Address: Director of Telegraphs, Reykjavik, Iceland.

Fortescue, Cecil L.—B. January 15th, 1881. Educ. Oundle School and Christ's College, Cambridge, First-class Honours, Mechanical Sciences Tripos, 1903. Engineering training with Messrs. Siemens Dynamo Co., Stafford, 1903-06. Civilian Instructor in Applied Mechanics and Electro-Technics at H.M. Gunnery and Torpedo Schools,

Portsmouth, October, 1906. During the war attached to Wireless Telegraphy Department, H.M.S. "Vernon," and at H.M. Signal School, Portsmouth. Professor of Phys.cs, Royal Naval College, Greenwich, since January, 1911. M.I.E.E., serving on Committee of Wireless Section of that Institution. Fellow of the Institute of Physics. Member of the Physical Society of London, serving on the Council. Member of Sub-Committee "D" on Thermionic Valve of Radio Research Board, of the Department of Scientific and Industrial Research. Address: Royal Naval College, Greenwich, S.E.10.

Franklin, Charles Samuel.—B. 1879. Received engineering and scientific training at Finsbury Technical College, under Professor Sylvanus Thompson. After some time spent in electrical work, first at Manchester and afterwards with the Norwich Electricity Company, joined Marconi's Wireless Telegraph Company (then known as the "Wireless Telegraph and Signal Company"), 1899, and still remains in their service. He has during recent years been engaged in conducting experimental and research work on behalf of Senatore Marconi, and has a number of important patents to his credit.

Frey, Emile.—B. 1838, Arlesheim, near Basel. Visited University of Tena, 1855-60. Visited United States and took part in American Civil War (1861-1865), serving with the Northern (or federal) army. Was made prisoner in the Battle of Gellisburg, July 1863. Designated by lot as hostage with two other prisoners for Captain Gordon and two other confederate officers. Condemned to death at Washington, May 3rd, 1864. Saved from the gallows by the action of President Lincoln, taking as hostage for Captain Frey, the confederate Captain Steward and two others. Breveted Major by President of the U. S. Johnson "for gallant and meritorious services during the war." Returned to Switzerland, 1865. Member and President of the Government of Basel-Compagne, 1866-1872. Editor of the "Basler Nachrichten," 1872-1882. Member of the National Council, 1872-1882, of which he was chairman from 1875-1876. Swiss Minister Plenipotentiary at Washington, 1882-88. Member of the Federal Council, 1890. Vice-President, 1893. President of Swiss Confederation, 1894. Resigned from the Federal Council, 1897. Director of the International Bureau of the Telegraph Union from 1899, and of the Radio-Telegraphic Union from 1910 until 1921. Was President of the Diplomatic Conference for the Protection of Labourers at Berne, 1907. Created Doctor Philosophical, *honoris causa*, by the University of Berne, 1912. Author of the military history of Switzerland, and of a number of other publications. Address: Arlesheim, near Basel.

Frouin, M.—Director of French Telegraphs, one of his country's representatives at the International Radiotelegraphic Conference, London, 1912.

Gardiner, B. C.—B. February 25th, 1879. Son of Rev. Canon W. Gardiner, B.D., of St. Albans Priory, Wallingford. Educ. at Marlborough College. Joined Royal Marines 1897. Supervised the erection of Bermuda Wireless Station 1907. Senior Instructor of Wireless Telegraphy at the Royal Naval Electrical School, H.M.S. "Vernon," 1910. Attached R.E. as the Instructor of Wireless Telegraphy at the Army School of Military Engineering, Chatham, 1913. Wireless officer on the staff of Lord Jellicoe 1914-1916. Fleet wireless officer on the staff of Earl Beatty 1916-1918. Awarded Brevet Lieut.

Col. and C.B. Head of the Wireless Telegraphy Board 1920. Admiralty representative at the Allied Conference on Electrical Communications at Washington 1920 and at Paris 1921. M.I.E.E. Address: St. Albans Priory Wallingford, and United Service Club.

Gentil, Captain Antonio Alves Soares Branco.—B. March 7th, 1874. Educ. at the Polytechnic and Naval Schools. Between 1893 and 1909 filled various Naval posts in Angola and Mozambique. Qualified as Torpedo Operating Officer at the Torpedoes and Electricity School of Val de Zebro in 1909; appointed Instructor of Wireless Telegraphy at the same school in 1911. Qualified as Submarine Commander in 1915. In 1916 became member of the Technical Committee of Naval Wireless Telegraphy appointed to investigate and make recommendations concerning wireless in all Portuguese Colonies. Appointed to the Naval Staff, August, 1918. Member of Technical Committee of Portuguese Naval Wireless Telegraphy. Address: Majoria General d'Armada-Estado Major Naval, Lisbon.

Girardeau, Emile.—B. 1882. Educ. Ecole Polytechnique. Joined the Army and served as an officer in the Engineers. Managing Director Cie, Générale de Télégraphie Sans Fil, Cie Radio-France, Société Française Radio-Electrique. Director of Radio-Maritime, Sté Anonyme Internationale de T.S.F. (S.A.I.T.), Sté Radiotechnique, Sté Radio Romana, etc.etc. Author of various works on a number of subjects relating to wireless telegraphy. Founder of the Société Française Radio-Electrique. Member of the High Committee appointed by the French Government for Wireless. Member of Légion d'Honneur. Address: 79, Boulevard Haussmann, Paris (8e).

Glazebrook, Sir Richard Tetley, Kt., K.C.B., M.A., D.Sc., F.R.S.—B. Liverpool, 1854. Educ. Trinity College, Cambridge. Fifth Wrangler. Studied Physics as Graduate at the Cavendish Laboratory, Cambridge, under Clerk Maxwell and Lord Rayleigh. Fellow of Trinity College, Cambridge (1877). Principal of University College, Liverpool (1898-99). First Director of the National Physical Laboratory (1899-1919). Chairman of the Aeronautical Research Committee. Zaharoff Professor of Aviation and Director of the School of Aeronautics, Imperial College. Past President of the Institute of Electrical Engineers. Medal of the Royal Society of Arts (1918). Member of Technical Committee inquiring into Imperial Wireless scheme. Publications: Numerous works on Physical Optics, Laws and Properties of Matter, text-books on Heat, Light, Mechanics and Electricity, as well as numerous papers in Scientific and Technical Journals. Address: 5, Stanley Crescent, Notting Hill, W.

Gold, Lieut.-Col. E. D.S.O., F.R.S.—B. Berks-well, Warwickshire, July, 1881. Educ. King Henry VIII's Grammar School, Coleshill; Sir Josiah Mason's College, Birmingham; St. John's College, Cambridge. (Third Wrangler, 1903.) Part II Natural Science Tripos, 1904. Lecturer in Mathematics, City of London College, Moorfields, 1904; Fellow St. John's College, Cambridge, 1906; Superintendent, Instruments Division, Meteorological Office, 1906; First Schuster Reader in Dynamical Meteorology (1907); Superintendent of Statistics, Meteorological Office (1910). Gazetted Capt., June, 1915, and attached G.H.Q. as Meteorologist to R.F.C. D.S.O. for services in Battle of Loos, and promoted Major. Appointed to command of new Meteorological Section, R.E. Mentioned in dispatches five times; promoted Lieut.-Col.,

March, 1918. Represented British meteorology in Aeronautical Convention at Peace Conference 1919. Research: Identification of negative "ions" in flames with "electrons" (1905); relation between barometric pressure and wind velocity (1906); atmospheric radiation (1907), Publications: Report on existing state of knowledge of upper atmosphere (read British Association, 1909); "International Kite and Balloon Ascents" (1911). Assistant Director of Meteorological Office; President International Commission for Weather Telegraphy. Address: 8, Hurst Close, Bigwood Road, London, N.W.11. Tel. Finchley 1209.

Goldschmidt, Professor Dr. Rudolf.—B. March 19th, 1876, at Neu-Bukow, Mecklenburg, Germany. Educ. Wismar Municipal School. Studied engineering at Charlottenburg and Darmstadt Technical High School. Engineer in the laboratory of the A.E.G. in Berlin, 1900. Chief laboratory engineer and designer in Prague, 1901-02. Chief engineer and designer at Cromptons & Co., Ltd., Chelmsford, 1902-05; similar position with Brit. Westinghouse El. and Man. Co., Manchester, 1905-07. Lecturer at Darmstadt Technical College, 1907. Here he practised as a consulting engineer, and also pursued the development of several inventions, chiefly occupying himself with the invention and design of high-frequency alternators for wireless telegraphy. Established (1911) two large wireless stations at Elbsee, Province of Hanover, and Tuckerton, New Jersey, U.S.A., for wireless communication between Germany and America. Address: Berlin-Westend, 45, Lindenallee, Berlin.

Goldsmith, Prof. Alfred N., B.Sc., Ph.D.—B. New York City, 1887. Educ. B. S. Coll. of the City of New York, 1907; Ph.D. Columbia Univ., 1911; Phi Beta Kappa; m. New York, N. Y., 1914, Elsie H. Borg; one son, Warren Randall. Consulting Radio Expert, U.S. Department of Justice, 1912. Consulting Radio Engineer Atlantic Communication Co., 1914. Consulting Engineer General Electrical Co., 1915-17. Director of Research, Marconi Wireless Telegraph Co. of America, 1917-19. Associate Professor in charge of electrical engineering, College of City of New York, since 1919. Director of Research Department, Radio Corporation of America since 1919. Editor, "Proceedings of the Institute of Radio Engineers," since 1912. Member U.S. Federal Radio Telephone Commission, 1922. Made investigations in simplex and duplex radio telegraphy and telephony, transmission of canal rays, precision measurements in radio engineering. Author, "Radio Telephony" (Wireless Press), 1918, "Radio Measurements," "Radio Frequency Changers" (Proceedings of the Institute of Radio Engineers), 1915, "World Communication" (Journal of the American Institute of Engineers), 1921. Technical Director U.S. Signal Corps School of Communication, 1917-18, U.S. Naval Radio School, 1917-18. Fellow, A.I.E.E., I.R.E., hon. member Radio Club of America, Radio Society of Great Britain, American Physical Society Club, the Static. Addresses: The College of the City of New York, and 450, West End Avenue, New York, N.Y.

Gottwaldt, Commander B. L.—B. Christiania, 1880. Entered Naval Academy, Norwegian Navy, 1898. Graduated sub-lieutenant, 1901. Attended the Military Academy of the Royal Navy, 1901-04, afterwards the Technical College, Charlottenburg, Berlin. At the latter studied electrical engineering, telegraphy,

telephony, and wireless telegraphy. Visited (1906) England on behalf of the Norwegian Admiralty to attend to some special work with Messrs. Armstrong, Whitworth Co., Newcastle-on-Tyne. Returned to Norway and placed in charge of W/T in the Royal Norwegian Navy, where he was responsible for the erection of naval, land and ship stations. Appointed Commander, 1912. Entrusted with the control and test of wireless apparatus ordered in England and Germany by the Norwegian Government. One of the Norwegian delegates at the International Radio Conference in London, 1912, Late Inspector of W/T, Norwegian Nav. Department. Technical Manager, Norwegian Wireless Company (Norsk Marconikompani). He has written a number of articles, and three books on wireless. Address: 15, Baldersgate, Kristiania.

Gray, Andrew, A.G.T.C.—B. Glasgow, 1873. Educ. Glasgow University; Royal Technical College. Diploma of latter in electrical engineering. Served as assistant to late Professor Andrew Jamieson, of Royal Technical College. Joined the West India and Panama Telegraph Company, Ltd. (1893), serving respectively as assistant electrician, chief electrician, and telegraph engineer. Entered Marconi Company, 1899. Introduced Marconi system to Hawaiian Islands. Organised telegraph working and training of native operators of Inter-island Telegraph Company of Honolulu. Appointed Chief of Staff to the Marconi Companies in 1901, and in that capacity organised the working of the ship and shore wireless service, designed the original 1½ kw. Ship Set, and supervised the ship and shore operating until 1906, when the engineering and traffic work were separated. Chief Engineer of the Marconi Parent Company since 1910. Address: 78, Creffield Road, Acton, W.3.

Grenfell, Wing Commander George Pascoe, D.S.O. (1917).—B. 1883. Educ. privately. Successively on staffs of Eastern Telegraph Co., Ltd.; Amalgamated Radio Telegraph Co., Ltd. (De Forest & Poulsen Systems); British Radio Telegraph Co., Ltd. Went overseas 1915 in charge of Wireless in R.F.C., Middle East. Served in Egypt, Senussi campaign, and Salonika. Transferred to H.Q. Staff—R.F.C., B.E.F., France, end of 1916. In charge of W/T (Communications and Artillery Co-operation). Mentioned in dispatches, 1917. Returned to England and joined Staff of Director of Air Organisation, Air Ministry, as S.O. 1, June, 1918. Appointed member of W/T Board, June, 1918. Took command of W/T Experimental Establishment, Biggin Hill, December, 1918. Address: R.A.F., Biggin Hill, Kent.

Guthrie, Frederick Preston.—B. August County, Virginia, 1891. Educ. Chamberlain-Hunt Academy, Port Gibson, Miss. Graduated from Washington Lee University, A.B. Degree, 1911. Vanderbilt Fellow in Astronomy, University of Virginia, 1911-12. Professor of Science, Miami Military Institute, Germantown, Ohio, 1912-13. Assistant Professor of Physics, The Citadel (the Military College of South Carolina) Charleston, S.C., 1913-17. Enlisted in South Carolina Naval Militia, 1915; promoted to Lieutenant, 1916; called to active duty in U.S. Navy, 1917; remaining on active duty until 1919; served at Charleston Navy Yard and in office of Director Naval Communications, Navy Department, Washington, D.C.; author, Communication Regulations, U.S. Navy, 1918. 1919, assigned to duty with United States Shipping Board Emergency Fleet Cor-

poration by order of Secretary of Navy, to organise Radio Service. Later, released from active duty in the Navy and appointed Manager of Radio Department, United States Shipping Board Emergency Fleet Corporation. Member of Committee appointed by Secretary of Commerce to consider EU—F—GB—I Radio Protocol, 1920. Member of American Delegation to meeting of Technical Committee on International Radio Communication, which met in Paris, 1921. Member of Inter-Department Advisory Committee on Government Radio Broadcasting, M.I.R.E. In charge of Radio Service of United States Shipping Board. Address: United States Shipping Board, Washington, D.C.

Gutton, T.—Prof. of the Faculty of Nancy. Delegate to the International Technical Wireless Committee (Paris, 1922). Contributions—On the simultaneous maintenance of oscillating and of harmonic circuits,—“Comptes Rendus de l'Academie des Sciences.” On the transmission and the reproduction of sounds by radiotelephone—“L'Onde Electrique.” On the damping of oscillations in relay amplifiers—“L'Onde Electrique.” On the simultaneous maintenance of several oscillating circuits by the same valve, Annales des Postes, Télégraphes et Téléphones. “The Three Electrode Lamp,” three lectures published by the “Société du Journal de Physique” and “Les Presses Universitaires de France.” 1 vol. 181 pages (which appeared in November, 1922). Address: University of Nancy.

Hammond, John Hays, Jr.—B. San Francisco, Cal., 1888. Educ. B.S., Sheffield Scientific School (Yale), 1910; Sc.D., George Washington University. Inventor of type of torpedo for coast defence, controlled by wireless energy from coast fortifications, which was recommended to Congress for exclusive purchase by U.S. by Board of Ordnance and Fortifications, U.S.A. Invented system of automobile torpedo firing type, in latest battleships of U.S.; also aluminothermic incendiary projectiles employed by Allied armies in the Great War; radio system of control of ships, employed on U.S.S. “Iowa,” for target practice; a system of coastal patrol by aeroplane which has been adopted by most of the coast states; a system of selective radio telegraphy, testing approved by U.S.N., U.S. Signal Corps and U.S.A.; system of aerial coast surveying adopted by the Bartlett expedition for Polar exploration. Has applied for over 224 patents in U.S. and Europe, relating to radio telegraphy and telephony and wirelessly controlled torpedoes. Former member Advisory Board United States Naval Board of Inventors. Member Advisory Committee Langley Aero-dynamic Laboratory of Smithsonian Institution. Co-operation with Third Naval Dist. Member Conference Committee on National Preparedness (Sub-Committee on Finance). Government Aero Club, America (Member Aero-dynamic, Technical, Public Safety and Map and Landing Places Committees). Vice-President, Director, American Society Aeronautic Engineers. U.S. delegate Radiotelegraphic Convention, London, 1912. M.I.R.E. America (ex-Treasurer, etc.). Hon. Member National Institution Inventors, Harvard Aeronautical Society. Fellow, American Geographical Society, Associate Member American Society M.E. Member Royal Society Arts, London. Clubs: Eastern Yacht, Yale, Engineers, University. Home: Gloucester, Mass.

Harbord, James G., Major-General.—B. Bloomington, Ill., 1866. Farmer boy, country

school teacher. Recruit, Company A. 4th Infantry U.S. Army. Commissioned 2nd Lt. 1897. Service in Cuba, Porto Rico and the Philippines covering some sixteen years, during which period he won many distinctions. Appointed Lt.-Col. 1917 and accompanied Gen. Pershing to France as Chief of Staff, serving in this capacity during the period of organisation of the A.E.F. Commanded the Marine Brigade of the Second Division in the Verdun Sector and during the fighting in the Bois de Belleau, Bour-esches and near Château Thierry. Promoted Major-General of the National Army 1918, and commanded the Second Division at Soissons. Returned to U.S. 1919 and promoted Major-General U.S. Army. Deputy Chief of Staff U.S. Army. Elected President Radio Corporation of America January 1st, 1923.

Harrison, Lieut.-Col. Norman, C.M.G., D.S.O. — B. 1873. Educ. in Natal. Served in South African War and European War, 1914-19, as Director of Army Signals in German South-West Africa, and as Assistant Director of Army Signals, and Commanding South African Signal Units (attached to Corps of Royal Engineers) in France, 1916-19. Engineer-in-Chief of Posts and Telegraphs, Union of South Africa since 1919. Addresses: (1) G.P.O., Pretoria; (2) Pretoria Club, Pretoria; (3) Civil Service Club, Capetown.

Hogan, John V. L. — B. Philadelphia, Pa., U.S.A. Educ. Sheffield Scientific School, Yale University, honours in physics and mathematics, with special work in Graduate Physics Laboratories. Assistant to Dr. Lee de Forest, 1906-1907. Research, 1907-09. Joined National Electric Signalling Co. at Brant Rock, Mass., 1909. Telegraph Superintendent, 1910-11. Chief of Operating Inspection and Erection, 1911-14. With International Radio Telegraph Co. (successor of National Electric Signalling Co.), as Chief Research Engineer, 1914-17. Commercial Manager, 1917-18. Manager, 1918, and Executive Supervisor of Design, Research, Manufacture, Sales and Operation until 1922. Now Consulting Engineer, specialising in radio acoustics and patent matters. Fellow, Manager and Past-President, Institute of Radio Engineers. Member, American Institute of Electrical Engineers, American Association for Advancement of Science, Radio Club of America, and other technical societies. Author: "Inductance Coils Used in Wireless Telegraphy," 1909; "The Wireless Telephone," 1910; "Operation of Detectors in Wireless Telegraph Service," 1911 — all in *Electrical World*; "Ein fruhes drahtloses Telephon" (*Jahrbuch der drahtlosen T. und T.*), 1912, etc. Presented addresses before Johns-Hopkins University, Institute of Radio Engineers, American Institute of the City of N.Y., Union League Club, Pan American Scientific Congress, Society of Wireless Telegraphy Engineers, etc. Address: 41, Park Row, New York City, U.S.A. Residence, Forest Hills, Long Island, N.Y.

Holmstroem, J. Gunnar. — B. Stockholm, April 23rd, 1874. Passed through Poly. Acad. Stockholm, 1896. Assistant Royal Swedish Telegraph Dept., 1892. Teacher at Swedish Artillery and Engineers' College, 1904, and College for Naval Officers, 1908. Director of Radiotelegraphic Instruction, Stockholm, Kt. of "Vasa" Order. Publications: "Lärobok in Telegraf," 1914, and "Handbok i Radiotelegrafi," Stockholm, 1908. Address: Malmskillnadsgatan 19 B, Stockholm.

Hooper, Commander Stanford C. — B. August 16th, 1884, Colton, Cal. Educ. at San Bernardino, California. Started his career as telegraph operator in the Southern Pacific Company, afterwards transferring to the Postal Telegraph Company. Entered the Naval Academy, Annapolis, Md., September 6th, 1901. Graduated January 31st, 1905. Served as midshipman on the cruiser "Chicago," destroyer "Perry," and monitor "Wyoming," and later on various ships as ensign, 1907, Lieutenant, 1910, Lieutenant-Commander, 1915, Commander, 1918. Instructor of electrical engineering, physics, and chemistry at the U.S. Naval Academy, 1910-11. Fleet Radio Officer of the United States Atlantic Fleet, 1912-13, taking part in the capture of Vera Cruz, Mexico. Early in the war acted as observer in Europe. In charge of the Radio Division Bureau of Steam Engineering, Navy Department, 1915-17. Commanded the destroyer "Fairfax" in the Atlantic during 1917-18, then returned to take up duties as Chief of Radio material, construction, supply and Development in the Bureau of Engineering attached to the U.S. Navy. Largely responsible for design and construction, U.S. Naval High Power Radio Stations, Annapolis, San Diego, Pearl Harbor, Cavite, Guam, Samoa, and others, also for radio compass system established by U.S. Navy. Address: Navy Dept., Washington, U.S.A.

Hope-Jones, Frank. — B. 1867. From 1890 to 1895 associated with his elder brother, Robert Hope-Jones, in some of his earliest applications of electricity to organ-building. Has established the business of electric time service on a scientific basis. M.I.E.E., the British Horological Institution, and the Worshipful Company of Clockmakers. Author of numerous contributions to technical journals and to the Proceedings of Scientific Societies. Chairman, Radio Society of Great Britain. Address: 32 and 34, Clerkenwell Road, E.C.1.

Howe, Prof. George William Osborn, D.Sc. — B. 1875, Charlton, Kent. Educ. the Roan School, Greenwich, Woolwich Polytechnic, Durham University. Nine years with Siemens Bros., at Woolwich, and Siemens and Halske, at Charlottenburg. Two years lecturer at Hull Technical School. Lecturer and later Assistant Professor of Electrical Engineering at the City and Guilds Engineering College, Imperial College of Science and Technology at South Kensington. Head of the Department of Electric Standards and Electric Measurements at the National Physical Laboratory, 1921. Appointed in the same year to James Watt Chair of Electrical Engineering in the University of Glasgow. D.Sc. of Durham, hon. D.Sc. of Adelaide University. Whitworth Scholar. Has read several papers on Radiotelegraphy before the Royal Society, the British Association, the Physical Society, etc. Awarded the silver medal by the Royal Society of Arts (1912) for his paper on "Some recent Developments in Wireless Telegraphy." Vice-President of the Physical Society. Member of the Radio Research Board. Chairman of the Wireless Section of the Institution of Electrical Engineers. Address: The University, Glasgow.

Hoyle, Lieut. Bertram, M.Sc. — B. Oldham, 1888. Educ. College of Technology, Manchester, and at the Victoria University, Manchester. In 1907 he obtained the Certificate and Diploma in Technology and M.Sc. (Tech.) of Victoria University. Served with Messrs. Henry Simon, Ltd., Manchester, and with Messrs. S. Z. de Ferranti, Ltd., Hollinwood. Assistant Lecturer

and Demonstrator in Electrical Engineering at the College of Technology, Manchester, 1911. Had charge of the design and erection of the wireless station with which the School of Technology is equipped. Enlisted early in 1915 as a motor cycle despatch rider, and served on the Western Front. In September, 1915, gazetted Lieut. R.N.V.R. In 1922 embarked upon private wireless research. Author of "Standard Tables and Equations," and a number of technical essays and monographs. Address: 18, King's Drive, Heaton Moor, near Stockport.

Isaacs, Godfrey C.—Educ. England, France, and Germany. Began life in his father's business and a few years later was manager. Deputy-Chairman and Managing Director of Marconi's Wireless Telegraph Company, Ltd., and Managing Director of the Marconi International Marine Communication Company, Limited. Address: Lyne Grove, Virginia Water, Surrey.

Isbell, Arthur A.—Started in telegraph business in 1893, as a messenger for the Western Union Telegraph Company, at North Adams, Mass., U.S.A. Entered service of original De Forest Wireless Telegraph Company, New York, in 1902. Later associated with Professor R. A. Fessenden for three years in numerous experiments in U.S.A. and Scotland. First merchant marine radio operating in the Pacific Ocean on steamer "President," in 1907. In 1908 built semi-high power station in Hawaiian Islands, and established first wireless communication between the Islands and the mainland of United States. In 1910 erected first wireless station at Wellington, New Zealand. Division Superintendent, United Wireless Telegraph Company, New Orleans and San Francisco. Built Alaskan Circuit for Marconi Wireless Telegraph Company of America. 1917-1918, Expert Radio Aid, Navy Department, Washington, D.C. General Superintendent, Pacific Division, Radio Corporation of America, San Francisco.

Jackson, Admiral of the Fleet Sir Henry Bradwardine, G.C.B., K.C.V.O., D.Sc., LL.D., F.R.S.—B. Barnsley, January 21st, 1855. Entered Royal Navy December, 1868. Capt. 1896; Rear Admiral, 1906; Controller of Navy, 1905-08; Commanded 6th Cruiser Squadron, 1908-10; Chief of Naval War Staff, 1912-14; First Sea Lord, May, 1915-December, 1916; President R.N. College, Greenwich, 1917-19. Hon. Vice-President of Inst. of Naval Architects. Vice-President of Radio Society of Great Britain. Chairman of Radio Research Board, 1920. Hon. D.Sc. Leeds and LL.D. Cantab. Whilst Commander of H.M.S. "Edinburgh," in 1893, conceived the idea of using Hertzian Waves for Naval signalling purposes, especially in connection with torpedo boat work, experimented intermittently in this direction by exciting a circuit which included a filings coherer tapped by the hammer of a high-resistance trembling bell. Continued to take much interest in the development of W/T, and assisted in its organisation in the Navy. Addresses: 37, Catherine Street, London, S.W.1, and The Athenæum Club.

Janet, Paul.—B. 1863, Paris. Studied at the Lycée Louis-le-Grand and the High School. Member of the French Society of Physics, the French Society of Electricians, and the Society of Civil Engineers of France. Professor of Physics at the University of Grenoble, 1886-94. Member de l'Institut. Professor of Physics, University of Paris, Director of the Central Laboratory and of the High School of Electricity. Author of several important works. First to make a successful

experiment in electric resonance by means of high-frequency currents, 1892. Address: Ecole Supérieure d'Electricité, 12 and 14, Rue de Staël, Paris (xve).

Jenner, Axel.—B. 1885. Student 1904. Assistant at the Swedish Telegraph Service 1905. Passed the course for superintendents of the wireless stations 1916. Since 1916 superintendent of the wireless station at Boden, Sweden. Address: Boden, Sweden.

Jotikasatira Hang.—B. at Bangkok, September 27th, 1876. Educ. at Bangkok and at Penang. In 1890 was sent to Europe to be educated as an engineer. Studied seven years at Erfurt, and entered the Technische Hochschule at Hanover in 1897. On passing the final examination of that school in 1902, returned to Siam and joined the Siamese Navy as an Engineer-Lieutenant. 1907-12, an instructor in the Naval Cadet School. Awarded the title of Luang Nava Vichitr, 1911. Joined the Naval General Staff as the Chief of the Wireless Department, 1912. Promoted Commander, 1918. Awarded the title of Phra Vidyayā Dūralikhit, 1920. Captaincy, 1920. Address: Bangkok.

Jouaust, Raymond.—B. 1875. Licentiate of Science—Ingenieur Diplômé de l'Ecole Supérieure d'Electricité de Paris. Director of the Laboratoire Central d'Electricité and Ingenieur a l'Etablissement Central du Materiel de la Radiotélégraphie Militaire. Contributed the first tomes of research on the magnetism of iron and on electrical units. Since 1914 has been principally occupied on questions relative to 3-electrode valves and amplifiers.

Julien, L. (Major of Engineers).—B. Paris 1880. Was a pupil of l'Ecole Polytechnique and l'Ecole Supérieure d'Electricité a Paris. 1913-1914 attached to the wireless station of the Eiffel Tower; 1914-1919 attached to the Radiotelegraphic Service of the armies. At the end of 1919 became Director of all stations under the control of the Ministry of War. Address: Chef du Centre Radiotelegraphique, Ministère de la Guerre, Paris.

Kadōka, Hayao.—B. Tokyo, March, 1883. Graduated from the Tokyo Imperial University, July, 1906. Studied at the Earthquake Investigation Committee in the Dept. of Education, November, 1908. Lecturer at the Science College of the Tokyo Imperial University, March, 1909. Served in the Army, for researches on radiotelegraphy. Proceeded to Europe and America for inspection of the war-time condition of radiotelegraphy, 1917-1918. Since 1911 designed several radio stations. Address: 114, Sanya Yoyogi, Tokyo.

Kajima, Akira.—B. Tokyo, 1883. Graduated from the Greek Catholic Mission School, Tokyo. 1904, and became publisher of a religious magazine. Interpreter at the French Embassy from 1905 to 1906. Received a medal in recognition of distinguished services. Joined the editorial staff of the *Chuo Shimbun* in 1906, and that of the *Kokumin Shimbun* in 1908. Established the Japanese Wireless Press Agency in 1911, and the Nippon Radio Apparatus Manufacturing Company, 1915, which was converted to the Nippon Radio Telegraphy and Telephony Co., Ltd., 1920, and became the Managing Director the same year. Retired 1921. Started a monthly magazine named *Museu no Nippon* or Wireless Press in 1918. Private residence: 46, Kobinata-Daimachi 1-chome, Koishikawa, Tokyo.

Kellaway, Rt. Hon. Frederick George.—B. Bishopston, Bristol, 1870. Second son of the late William Hamley Kellaway, of Kingsdown, Bristol. Educ. Bishopston, Bristol. P.C. 1920. Parliamentary Secretary Ministry of Munitions, 1916. Deputy Minister of Munitions 1918. Secretary to Department of Overseas Trade, 1920, holding the double titles of Additional Under Secretary of State for Foreign Affairs and Additional Parliamentary Secretary to the Board of Trade. Postmaster-General, April, 1921. Member of Parliament, Coalition Liberal, Bedford, from December, 1910 to November, 1922. Joined Board of Marconi Wireless Telegraphy Co., November, 1922. As Postmaster-General secured reduction in postal rates on letters, postcards and printed papers. During his term of office was responsible for the institution of Broadcasting and Wireless Telephony.

Kennedy, Sir A. B. W., F.R.S.—B. London, 1847. Had great mechanical engineering experience. Some time President of the Institution of Civil Engineers, and the Institution of Mechanical Engineers. Professor of Engineering at University College, London, 1874-89, and founded there the first "Engineering Laboratory." Designed electric lighting and power stations for many companies and corporations, and has also been engaged in railway and constructive work. Knighted 1905 for his services to the Admiralty. Member of the Technical Committee appointed by the Postmaster-General to consider the Imperial Wireless Scheme. Civilian Member of the Ordnance Committee. During the War was Member of the Munitions Inventions Panel, and Vice-chairman of the Anti-Aircraft Equipment Committee (Ministry of Munitions). Consulting Electrical Engineer to the L.N.W.R., L.S.W.R., and the London County Council. Chairman of the Electn. of Railways Advisory Committee (Ministry of Transport). Addresses: A7, The Albany, Piccadilly, and Broadway Court, S.W.

Kennelly, A. E.—B. Colaba, Bombay, December 17th, 1861. Educ. in England, Scotland, Belgium, France and Italy. Past-President of the American Institute of Electrical Engineers, Past-President of the American Association of Illuminating Engineers; President, in 1916, of the Institute of Radio Engineers; Vice-President of the International Electrical Congresses, Paris and Turin; General Secretary of the Congress at St. Louis, Mo., U.S.A. Left school in 1875 to become a telegraph operator in the Eastern Telegraph Company. Chief Electrician on Cable Ship, 1881; Senior Electrician ship staff, E.T.C., 1886. Principal electrical assistant to Thomas A. Edison, in the laboratories at Orange, N.J., 1886-92. Consulting Engineer in Philadelphia. In partnership with E. J. Houston, of the Thomson-Houston Company, 1893-1900, Engineer-in-Chief when the cables were laid from Vera Cruz to Campeche, 1902. Professor of Electrical Engineering at Harvard University since 1902 and also at Massachusetts Institute of Technology since 1914. Corresponding Fellow of the British Association for the Advancement of Science; Honorary Member of the Institution of Electrical Engineers of London and has twice received one of its premiums for papers. Honorary Member of the Société Française des Electriciens. Director of Research Division of the Electrical Engineering Department, Massachusetts Institute of Technology, and Fellow of the American Academy of Arts and Sciences. He has written twenty-four books as author or collaborator, one of which is considered a standard elementary exposition of wireless telegraphy, and is author of more than

120 scientific papers. Honorary degrees include the S.D. of University of Pittsburgh, Docteur of the University of Toulouse, and A.M. degree of Harvard University. Some time Chairman and Secretary of Standards Committee, American Institute of Electrical Engineers, President and Secretary of the American Committee of the International Electro-Technical Commission. On duty as exchange Professor in French Universities, 1921-22. Member National Ac. Sciences. A delegate to the Inter-allied Radiotechnical Committee in Paris, 1921. Has specialised in alternating currents. Address: Harvard University, Cambridge, Mass., U.S.A.

Kift, A. A.—B. London, 1881. Educ. City of London School and Finsbury Technical College. Joined Marconi Company, 1902. Acted as erecting engineer supervising the installation of many of the earlier ship stations, including those on board the first vessels of the White Star fleet to be equipped. In charge of the installation of the Post Office Wireless Stations at Lochboisdale, Tobemory and Bolt Head. Chief of the Estimating Department of Marconi's Wireless Telegraph Company, 1911. Chief of the Sales Department, 1921. Address: Marconi House, Strand, W.C.2.

Kimura, Shunkichi, Ph.D.—B. 1866. Graduated Scientific College of the Tokyo Imperial University, in the department of Physics, 1888. Lecturer of the First High School in Tokyo. Studied Mathematical Physics in Harvard and Yale Universities 1893-95. Received the degree of Ph.D. (Yale), 1895. Member of Sigma Xi Society. Visited Holland. Co-founder with Dr. Molenbroek, assisted by Professor Tait, of Edinburgh, and Dr. Joly, of Dublin, of the Association for Promoting the Study of Quaternions and Allied Subjects. Returned to Japan. Professor of the Second High School in Sendai. Transferred to the Imperial Japanese Navy, 1901, to investigate wireless telegraphy for naval use. Invested with Order of Rising Sun (5th Class), 1903. Invested with Order of Rising Sun (3rd Class) with annuity, 1906. Fellow of the Royal Society of Arts, 1906. Japanese delegate to the International Wireless Telegraph Conference, Berlin, 1906. Retired from the Navy, 1912. Patent Attorney, with office at the Mitsui Building, Honkawayacho, Nihonbashi, Tokyo. Director of various companies, including the Nippon Radio Telegraph and Telephone Company. Engaged in the successful litigation of the General Electric Company against some Japanese firms for infringement of the patents with respect to ductile tungsten. Author of several papers on wireless telegraphy. Address: Momosono, Nakano, Tokyo.

Klein, Rene Henri.—B. 1880, Souls sous Forêt, France, Licentiate in Consul of Sciences, Antwerp Consulate School, experimenter in wireless telegraphy since 1908. Founder and first Hon. Secretary of the Wireless Society of London 1913-1920, now Vice-President. In conjunction with H. L. McMichael was responsible for the new synthetic galena crystal, "Radiocite." Contributions to numerous journals. Served in R.A.F. 1916-1918 in Instructional Wireless Section. M.I.R.E. (Amer.) and Director of L. McMichael, Ltd., and B. Hesketh, Ltd., Wireless Engineers.

Kojima, Kiyoshi.—B. Tokyo, January, 1889. Graduated from the Science College of the Kyushu Imperial University, July, 1915. Entered the service of the Department of Communications and engaged in scientific researches at the Electrical Laboratory under Dr. Wichi Torikata. Joined Nippon Radio

Apparatus Manufacturing Company as chief of Engineering Department, April, 1916, and became a director when the above company was changed to the Nippon Radiotelegraphy and Telephony Co., Ltd., 1920. Address: 1280 Shimo-Shibuya, suburb of Tokyo.

Kolster, Frederick A.—B. Geneva, Switzerland, January 13th, 1883. Educ. Public Schools of Cambridge, Mass., and at Harvard University. Assistant to John Stone Stone 1902-08. Assistant to Lee De Forest, 1909-12, Chief of Radio Section, Bureau of Standards 1912-21, since when Research Engineer, Federal Telegraph Co. Attaché to American delegation representing the U.S. at London International Radio Convention, 1912. Author of: "Effects of Distributed Capacity in Coils," Procds. I.R.E.; "Re-enforced Harmonics in Radio Transmission," Procds. I.R.E.; "A Direct Reading Instrument for Measuring the Logarithmic Decrement of Electro-magnetic Waves," Bureau of Stds. S.P. 235; "The Radio Direction Finder and its Application to Navigation," Bureau of Stds. S.P. 428. Inventor of Kolster decremeter, Radio Compass and Position Finder, Directional Radio Systems, and other devices. Fellow I.R.E. (Amer.), Member I.E.E. (Amer.), Fellow G.S. (Amer.). Address: Cosmos Club, Washington, D.C.; Engineers Club, San Francisco, Cal.; or c/o Federal Telegraph Co., Palo Alto, California, U.S.A.

Koomans, Nicholas.—B. 1879, at Delft. Studied at Delft for mechanical and electro-technical engineer, obtaining his certificate 1901. For one year assistant in applied geometry, and for one and a half years in physics and electrical engineering at the Technical High School at Delft. Entered the Government Telegraph Service. Grad. 1908 at Technical High School at Delft as Doctor in Technical Sciences on the strength of a dissertation "Regarding the Influence of Self-Induction in Telephone Conducting Wires," containing theses in which are laid down the results of, and the conclusions from, experiments and measurements on Pupin cables of the Dutch telegraph administration. Joint-founder and editor of the Monthly Review of Telephony and Telegraphy. Joint-founder and member of the managing board of the Dutch Society for Radiotelegraphy (Nederlandsche Vereeniging voor Radiotelegrafie). Member of the International Electro-technical Commission. Member of State Patent Office. Professor in Physics and Theoretical Electrical Engineering at the school of the Dutch Post and Telegraph Administration. Supervises the instruction of all the higher officials. Address: Antonie Duyckstraat 24, The Hague, Holland.

Koto, Major-General, Teizo.—B. Yamaguchi prefecture, May, 1873. Entered the military service as cadet in the 6th Engineering Battalion, 1892, and promoted to 1st Lieutenant, May, 1898. Entered the Science College of the Tokyo Imperial University as a special student of School of Artillery and Engineering, 1900, and graduated therefrom 1903. Served in the Russo-Japanese War as the chief of the Field Telegraphy Corps, 1904. Promoted Major and appointed an inspector of the Military Technical Dept., 1905. Promoted Lieut.-Major and appointed Member of the Military Wireless Investigation Committee, 1910. Proceeded to China for the erection of a radio station on Chinwangtao Island, 1912. Promoted Colonel and Chief of the Communications Dept. of the Tsingtau Garrison, 1915. Engaged in the erection of radio stations at Hankow and Tsinan. Promoted Major-General

and Military Engineer, 1919. Address, 68, Tani-Machi, Ichigaya, Ushigome, Tokyo.

Korn, Professor Arthur.—B. Breslau, Germany, 1870. Studied at Leipsic and Paris in Mathematics and Physics. Professor of Physics, University of Munich, 1903-08. Best known as the inventor of a system of telegraphic transmission of photographs, and in 1907 the first photograph was transmitted under this system from Munich to Berlin, a distance of 600 kilometres. Inventor of a system of telautography and wireless phototelegraphy. Author of several mathematical works of a mechanical theory of gravitation and electricity and "Elektrische Fernphotographie und Aehnliches" Leipsic, 1904, and "Handbuch der Phototelegraphie und Telautographie," published in 1911 in collaboration with Dr. Glatzel. Professor at Polytechnical High School, Charlottenburg, Berlin. Address: Charlottenburg, Berlin Schlüterstrasse 25.

Krarup, T. F.—B. Copenhagen, 1868. Student 1885. Lawyer 1891. Head clerk to Criminal Judge at Frederiksberg, 1891. Assistant in the Ministry of Home Affairs, 1894. Assistant to Copenhagen Harbour Administration, 1896-1907. Head clerk to Ministry of Public Works, 1904; Chief from 1912. Vice-President of the Electricity Commission, 1907; Chairman from 1916. Chairman of the Cement Commission, 1917. Member and Secretary of the Telephone Commission of 1917, from 1917; Chairman from 1920. Chairman of the "Gudenaa" Commission and the other Commissions concerning water power plants, 1918, and of the Commission regarding Long Distance Radio Telegraph Stations. Knight of Dannebrog. At present Vice-President of the Danish Commission concerning the exchange of high-power current between Norway, Sweden and Denmark. Address: Frederiksberg Allé 55, Copenhagen V, Denmark.

Kroger, F. H.—Educ. University of Colorado. Graduated M.S. 1905. Apprenticed to the Westinghouse Electric and Manufacturing Co., East Pittsburg, 1905. Engineer at Brant Rock Transatlantic station of the National Electric Signalling Co., 1906. Radiotelegraph Adviser to the States Signal Corps (1907), which installed the Inland Radio Station in Alaska. Organised educational courses in electrical engineering and in radiotelegraphy at Cornell University, 1908-11. Joined the International Radiotelegraph Company, New York, 1911. Joined the Marconi Wireless Telegraph Company of America (1919) as division engineer at their factory. Joined staff Radio Corporation of America, 1920. Address: 85, Clarkson Avenue, Brooklyn, New York.

Kujirai, Tsunetaro.—B. 1882. Graduated Electrical College of Tokyo Imperial University, 1907. Sometime Wireless Engineer in the Department of Communications, Late Assistant and now Professor of the Tokyo Imperial University. Awarded the Academy prize and medal of the Japanese Imperial Academy. Member of the Institute of Physical and Chemical Research. Address: Tokyo Imperial University, Hongo, Tokyo, Japan.

Lagorio, Capitaine de Vaisseau.—Attached to Secus-Secrétariat des Pestes et des Télégraphes as director of Service de la T.S.F. (16th June, 1920). Address: Service de la T.S.F., République Française, Paris

Langmuir, Dr. Irving, M.A., Ph.D.—B. Brooklyn, New York, January 31st, 1881. Educ. School of Mines, Columbia University; Graduated 1903

as metallurgical engineer. Undertook post graduate work at University of Göttingen under Professor Nernst. Returned to America and became Instructor in Chemistry at the Stevens Institute of Technology, 1906-09. Entered Research Laboratory of G.E.C. at Schenectady, 1909, where his investigations have included Radio Telephone and Telegraphic Apparatus, Tungsten Lamps, Electric Heating Devices, Pure Electron Discharge Apparatus, Atomic and Molecular Structure, etc. During the war engaged on submarine problem and developed several successful detecting devices used by the United States Navy. Has been a frequent contributor to various scientific journals and published many scientific works. Addresses: G.E.C. Research Laboratory, Schenectady, New York. 6, Stratford Road, Schenectady, New York.

Latour, Marius.—B. October, 1875, in South-western district of France. Educ. University of Paris and Ecole Supérieure d'Electricité, Paris. For many years consulting Engineer to the General Electric Company of America. His inventions include improvements to the helicopter, submarine signalling and dynamo-electrical machinery. Paid special attention to the construction of high-frequency machines, which he originally attempted to design in the shape of monophasic or polyphasic machines grouped in cascade. Analysed the essential features of machines based on this principle, and showed their analogy and close relationship to those of Professor Goldschmidt. Designed the H.F. alternator with reduced number of stator slots known as the S.F.R. alternator installed at numerous stations, including Lyons and Caltano. Systematically studied the triode valve and originally propounded the four determining derivatives thereof. During the war engaged in research work at the laboratories of the Etablissement Central de la Télégraphie Militaire under General Ferrié. His system of elimination of the interference produced in telephone lines by neighbouring H.T. power lines has been installed throughout the whole of Northern France. Originally suggested and patented the system, now widely used, of H.F. multiplex telegraphy and telephony using triode valves for generation and reception. Has specialised in the development of high and low frequency valve amplifiers for the Société Française Radio-Electrique, of which he is Consulting Engineer. Chevalier de la Légion d'Honneur. Vice-President of the Société Française des Electriciens. Member of the American Institute of Electrical Engineers. Member of the Institute of Radio Engineers. Head Lecturer at the Ecole Supérieure d'Electricité. Address: 8, Square Desaix, Paris, XVe. Telephone: Saxe 85-88.

Lee, Major Albert G., M.C., B.Sc.—B. 1879. Entered Engineering Department of the Post Office 1903. Carried out some of the early experiments on loaded telephone lines. Served during war in France as O.C. No. 4 Telegraph Construction Coy. R.E., and later was Officer-in-Charge of Signals G.H.Q. British Delegate at International Technical Committee on Radio Communications, Paris 1921. Member of sub-committees of Radio Research Board on Thermionic Valves and also Radiotelephony. Head of Wireless Research G.P.O. Address: Engineering Department, G.P.O., London.

Lippmann, Gabriel.—Of the Académie des Sciences at the Bureau des Longitudes. Commander of the Legion of Honour. Director of Laboratory of the Ecole des Hautes-Etudes.

Professor at the Sorbonne. President of the Interministerial Commission on Wireless Telegraphy. Occupied primarily with electrical matters. Inventor of an apparatus employed in Military Wireless Telegraphy for receiving Wireless Time Signals. Foreign Member of the Royal Society of London. Address: Sous-Secrétariat d'Etat des Postes et Télégraphes, Paris.

Liström, Axle Sigurd.—B. Falun, Dalecarlia, September 3rd, 1881. Passed Maturity Examination, 1900. Examination of Electro-Technical Branch, Technical University, Stockholm, 1905. Entered the Telegraph Service, 1900. Inspector of wireless installations, 1913. Chief Engineer at the Radio Division of the Royal Telegraph Administration, Stockholm, 1920.

Ljungqvist, Seth.—B. Falun, Dalecarlia, Sweden, May 5th, 1880. Passed Maturity Examination, 1899, and Examination of Electro-Technical Branch, Technical University, Stockholm, 1904. Entered the Telegraph Service, 1899. Chief of the Radio Division in the Royal Swedish Telegraph Department, Stockholm, 1916. Address: Vanadisvägen 23, Stockholm.

Lodge, Sir Oliver, D.Sc., F.R.S.—B. Penkhal, Stalis, June 12th, 1851. Educ. at Newport (Salop) Grammar School; studied privately for several years. Entered University College, London, 1873. Graduated D.Sc. 1878. Reader in natural philosophy at Bedford College for Women, and Assistant Professor of Physics in University College, London, for several years and Professor of Physics at University College, Liverpool, 1881-1900. The First Principal of Birmingham University, 1900. Knighted, 1902. Original investigations on lightning, the seat of the electromotive force in the voltaic cell, the phenomena of electrolysis and the speed of the ion, the motion of the ether near the earth, and electromagnetic waves and wireless telegraphy. His patent (1897) for syntonic wireless telegraphy was extended for seven years by Lord Parker, and was acquired by the Marconi Co. in 1911. Has held the position of President of the British Association, President of the Physical Society, and of the Society for Psychical Research. Has made many important contributions to the literature of science, amongst which are "Modern Views of Electricity" (Macmillan), "Electrons" (Ball), "The Ether of Space" (Harper's), "Electro-Mechanics" (Chambers). Address: Normanton, Lake, Salisbury.

Loflin, Edward Hill, Lieut.-Commander, U.S. Navy.—B. Deatesville, Alabama, 1885. Educ. Public Schools, Pensacola, Florida. Appointed to U.S. Naval Academy from Third Congressional District, Florida, and entered 1904; graduated 1908. 1912 to 1913 in command of U.S. Torpedo Boat "Bailey," engaged in special radio experimental work for Navy Department. 1913 to 1914 Post-graduate School, Annapolis, Maryland. 1914 to 1915 Post-graduate work in radio and electrical engineering, Columbia University, with degree of Master of Arts. 1916 to 1917, District Radio Communication Superintendent, Eighth Naval District, with additional special duty in development of radio for naval aircraft. 1917 Radio Officer Battleship Division Five, Atlantic Fleet. 1917 to 1918, Radio Officer for U.S. Naval Aviation Forces, Foreign Service. 1918 Communication Officer, U.S. Naval Forces in France, followed by special duties, liaison between U.S. Navy and French Government for construction of Lafayette High Power Radio Station and establishment of a radio communication service between Europe and the United States in case of failure of cables.

Member of Inter-allied Radio Conference. Member of Inter-allied Code and Signal Conference. 1918 to date, Radio Division, Bureau of Engineering, Navy Department, in charge of Research and Patents. Special duty 1919 to 1921, Chairman of Interdepartmental Radio Board to make recommendations on claims against the Government for use of radio patents. 1921, member of the American Delegation to the meeting, in Paris, of the Provisional Technical Committee of the International Communications Conference.

Loring, Commander F. G., R.N.—Inspector of Wireless Telegraphy General Post Office. Entered the Navy in 1882 (retired 1910). Lieutenant on H.M.S. "Victoria" when that vessel was rammed and sunk by H.M.S. "Camperdown" off Tripoli (1893). Received Bronze Medal of Royal Humane Society for saving two lives. In charge of Admiralty shore wireless stations 1902-08. Admiralty delegate at Berlin International Conference on Wireless Telegraphy, 1906. Appointed Inspector of Wireless Telegraphy, 1908. Post Office delegate at International Conference on Wireless Telegraphy, London, 1912. Technical Adviser to the Board of Trade on Wireless matters at International Conference on Safety of Life at Sea, London, 1914. Address: The Old House, Foot's Cray, Kent.

Lyons, Colonel Henry George, D.Sc., F.R.S.—B. October 11th, 1864. Educ. Wellington College, Director-General of the Survey Department in Egypt, 1898-1909. Victoria Research Medal, R. Geog. Soc., 1911. Lymans Gold Medal of Royal Meteorological Society, 1922. Member of the Meteorological Committee, 1913. Commandant Army Meteorological Services during the War; Acting Director Meteorological Office, 1918-19. Chairman of Sub-Committee "B" on Atmospherics of Radio Research Board of the Department of Scientific and Industrial Research. Chairman National Committee for Geodesy and Geophysics. Director and Secretary Science Museum. Address: 3, Cambridge Square, W.2.

Machado, Alvaro de Melo.—B. February 22nd, 1883. Entered Portuguese Naval Service, 1904. Commander and Torpedo Operating Officer of the Naval College of Val de Zebro, and elected Member of Portuguese Academy of Science for his original design of wireless-controlled torpedo in 1907. In 1915, whilst only Second Lieutenant became Manager of the Electrical Services of the Marine Arsenal and was responsible for the direction of the installations made in the National Naval Units and Land Stations of the Navy. Reorganised the dismantled wireless on German vessels, confiscated during the war. Received Portuguese Distinguished Service Medal, and made Member of the "Académie Française" in 1917, in acknowledgement of his wireless work. Address: Ministry of Commerce, Lisbon.

Makower, Capt. W., M.A., D.Sc.—B. December 6th, 1879. Educ. University College School and University College, London. Took honours degree in Chemistry at the University of London, 1900. His early research work relates to investigations in heat, but on proceeding to Trinity College, Cambridge, 1902, commenced investigations at the Cavendish Laboratory on radio activity. Elected to a Research Fellowship in the University of Manchester. Subsequently Assistant Director of the Physical Laboratories. Continued these researches until 1917. Joined the R.N.V.R. as a lieutenant, 1917, and subsequently became captain in the R.A.F. During the war, at the Air Ministry Laboratory in the

Imperial College of Science and Technology, working on thermionic valves and other matters connected with wireless telegraphy. Since the Armistice has been engaged on various problems connected with wireless telegraphy and navigation being investigated at the Air Ministry Laboratory. Most of his scientific publications have been in connection with radio-activity, of which, perhaps, the most important are on the subject of radio-active recoil, which he discovered with Dr. S. Russ in 1909, and he was awarded the degree of D.Sc. at London as a result of his early investigations in this subject. Of his other contributions to Science are his work on the Electric State of the Upper Atmosphere and his books on Radio-Active Substances and Practical Measurements in Radio-activity. Elected a fellow of University College, London, 1912, and for some years past has acted as Recorder of Section "A" of the British Association.

Makower, A. J.—B. May 9th, 1876. Educ. University College School, Gower Street, and at the College itself, between 1884 and 1895. Studied mathematics at Trinity College, Cambridge, taking his degree, 1898. Proceeded to Technical School, Charlottenburg, Germany, and obtained valuable insight into German methods. Joined the British Thomson-Houston Company, Rugby. Received an appointment at the South-Western Polytechnic, Chelsea, 1904. As head of the Electrical Engineering Department at the Polytechnic, was closely connected with the University of London, of which he was a teacher. At one time Secretary of the Board of Studies in Electrical Engineering, and Chairman of the Board of Examiners in Electrical Engineering. Author of many papers on wireless subjects. Resigned his teaching post and became managing director of Mossay & Co., Ltd., designers and selling agents for commercial electric vehicles, 1918. Chairman of the Electric Vehicle Committee of the Society of Motor Manufacturers and Traders. Addresses: 12, Greencroft Gardens, N.W.6, National Liberal Club, and The Oxford and Cambridge Musical Club, and 7, Prince's Street, S.W.

Marchant, Edgar Walford, D.Sc.—B. 1876. Educ. University College, Hastings, and Central Technical College. Graduated B.Sc. at London University with honours in physics and mathematics, and subsequently took the degree of D.Sc. After serving an apprenticeship appointed Superintendent of Lord Blythwood's Laboratory and Workshops at Renfrew, N.B., 1897, where he carried out many experiments in wireless telegraphy. Leaving Renfrew in 1900, served as chief assistant for one year at the Finsbury Technical College under the late Professor Silvanus P. Thompson. Lecturer in electro-technics at University College, Liverpool, 1901, and on the establishment of a Chair of Electrical Engineering in 1903 was elected the first professor. Closely associated with the late Mr. Duddell in the development of the oscillograph and joint author of a paper read before the Institution of Electrical Engineers on the study of the electric arc by the aid of oscillographs. Author of a number of articles on wireless and cognate subjects. David Jardine Professor of Electrical Engineering in the University of Liverpool. Vice-President of the Institution of Electrical Engineers. Member of British National Committee of Radiotelegraphy. Vice-President of the Radio Society of Great Britain. Past President of the Liverpool Engineering Society, Past Chairman of the Manchester Section of the Institution of Electrical Engineers. Address: 2, Ivanhoe Road, Sefton Road.

Liverpool. University Club, Liverpool, Royal Liverpool Club.

Marchant, W. H..—B. London, March 22nd, 1881. Commenced experimental work in connection with W/T (1904). From 1906-11 he served with De Forest Syndicate, Poulsen Company, and Lepel and Anglo-German W/T Companies, being chiefly engaged in experimental work. Since 1911 he has devoted himself mainly to literary work and to teaching. At present in the service of the Eastern Telegraph Co., at their London training-centre. Address: 4, Branch Hill Side, Hampstead, N.W.

Marconi, Alfonso.—B. Bologna, 1865. Educ. Bedford Grammar School, England, and Technical Colleges in Florence and Leghorn. Assisted his brother in carrying out his first experiments in Wireless Telegraphy on one of his father's estates near Bologna. Joined the board of Marconi's Wireless Telegraph Company and the Marconi International Marine Communication Co., Ltd., July, 1909. Addresses: D2, The Albany, Piccadilly, London, W., The Bath Club, Dover Street, W., Royal Thames Yacht Club, 80, Piccadilly, W.

Marconi, Senatore Guglielmo, G.C.V.O., LL.D., D.Sc.—B. Bologna, Italy, April 25th, 1874. Irish on his mother's side. Educ. Leghorn and Bologna. First interested himself in the problem of wireless telegraphy, 1895. Visited England, 1896, and took out the first patent ever granted for a practical system of wireless telegraphy by the use of electric waves. Earliest experiments in England made at Westbourne Park. Shortly afterwards made some experiments for the Post Office officials. The Italian Government conferred upon him the honour of knighthood. He has been decorated by the King of Italy and the late ex-Czar of Russia, is an honorary doctor of many universities, including Oxford, Glasgow, Aberdeen, Liverpool, and Pennsylvania, besides having received the freedom of the principal Italian cities. In 1909 (in conjunction with Professor Braun) he was awarded the Nobel Prize for Physics. In 1912 he was decorated with the Grand Cross of Alfonso XII and made Grand Officer of the Order of St. Maurice and Lazarus. Elected a senator in the Italian Parliament (1914), being formally introduced to the Assembly on March 27th, 1915. On July 24th, 1914, the King bestowed upon him the Honorary Knighthood of the Grand Cross of the Victorian Order. He also holds many scientific awards granted by various societies and institutions, including the Albert Medal of the Royal Society of Arts, of which he is Vice-President. April 12th, 1915, Awarded the Gold Medal of I.R.E. (America) College of the City of New York, June 20th, 1922, and John Fritz Gold Medal for the Invention of Wireless Telegraphy, July 6th, 1922. Immediately on the declaration of war by Italy, he was given the rank of Lieutenant in the Italian Army. He has been employed on important military missions to England by the Italian Government, and on July 29th, 1916, was promoted Captain "for exceptional services." At the beginning of September, 1916, he was transferred from the Italian Engineer Service to be temporary Commander in the Navy. He visited the United States, 1917, as Member of the Official Mission sent by Italy to the U.S.A. Government. The University of Columbia invested him with the honorary degree of Doctor of Science on June 6th, 1917. The Franklin Institute of Philadelphia conferred their Franklin Gold Medal upon him on May 15th, 1918. On June 26th, 1919, he

was appointed by H.M. the King of Italy Plenipotentiary Delegate to the Peace Conference at Paris, and in this capacity he signed the Peace Treaties with Austria and Bulgaria. At the end of 1919, he was awarded the Italian Military Cross. He has been decorated with the Italian "Ordine Civile" of Savoy, and has been nominated by the King of Italy to be a member of the Supreme Council of the same Order on the proposal of Signor Giolitti. He is Chairman of the Board of Directors of the Marconi Company. Address: Marconi House, Strand, W.C.2.

Marriott, Robert Henry.—B. 1879. First experimented with wireless telegraphy in 1899, while student at the Ohio State University, U.S.A. Employed by the American Wireless Telephone and Telegraph Company, Philadelphia, 1901, for which company he erected stations at Breille, Galilee and Barnegat, N.J. Chief Engineer of the Pacific and Continental Wireless Telephone and Telegraph Company. Installed three stations in California, at Avalon, Santa Catalina Island, and San Pedro, 1902. Employed with the Carstarphen Electric Company at Denver, Colorado, 1903. Constructed stations for the American De Forest Wireless Telegraph Company, and its successor, the United Wireless Telegraph Company, in Colorado, Wyoming, and Texas, 1905. In charge of this Company's construction and maintenance, 1910. Entered Marconi Wireless Telegraph Company of America, 1911. Entered the U.S. Government service as Radio Inspector, 1912. Chairman, 1916, Seattle Section Institute of Radio Engineers. Member of the Committee on Standardisation. Fellow and Past-President, The Wireless Institute, 1909-12.

Marvá, General J.—B. 1846. Practically the pioneer of Wireless Telegraphy in the Spanish Army. Founder of first Spanish Aerodrome at Cuatro Vientos. Author of many scientific works (*Mecánica aplicada a las construcciones, Tracción en ferreas, etc.*), Member, Royal Academy of Sciences, and International Association for experiments of materials.

McLachlan, Norman W., D.Sc. (Eng.).—B. Longtown, Cumberland, 1888. Educ. Carlisle Grammar School and the George Watson and the Heriot-Watt Colleges, Edinburgh, and Liverpool University. Served apprenticeship with Messrs. Bruce, Peebles & Co., In 1909 was appointed Lecturer in Engineering and Mathematics at Newcastle-on-Tyne. In 1913 Head of a Technical Institute, and Supervisor of Classes in Engineering Subjects in the Liverpool Technical Institutes. During the war carried out much research work for Government in aeronautics and anti-submarine devices organising a laboratory at Air Ministry for research on liquid and gaseous oxygen apparatus for aircraft use. After the Armistice engaged in magneto research at the National Physical Laboratory, Teddington. At present Research Engineer in service of Marconi Company. Associate of the Heriot-Watt College and a D.Sc. (Engineering) of the University of London. M.I.E.E., Fellow P.S. Lond. Fellow Inst.P. Author of many papers on various subjects in the Journal of the Institution of Electrical Engineers and other scientific journals. Holds patents for Wireless Telegraphy and allied subjects. Addresses: Marconi Works, Chelmsford and Engineers' Club.

McMichael, H. Leslie.—B. Birkenhead, 1884. Educ. Ackworth and Mason College, Birmingham. Apprenticed to Messrs. Duckett and Brown, Electrical Engineers, Birmingham, afterwards taking control of one branch of the

business. Among the first to hold a receiving and transmitting license in London and had a highly efficient station in London prior to 1914. His experimental work lay chiefly in the direction of sensitive synthetic crystals, and with Mr. R. H. Klein he was responsible for the synthetic crystal "Radiocite." One of the moving spirits in the foundation of the Wireless Society of London, and has taken an important part in its management since its origin; first in the office of Vice-Chairman, and since 1919 as Honorary Secretary of the Society. During the war served in the Wireless Instructional Section of the R.A.F., and now actively engaged in the wireless industry as Managing Director of L. McMichael, Ltd. Also a Director of B. Hesketh, Ltd., and other commercial concerns. M.I.R.E. Honorary Secretary, Wireless Society of London. Address: 32, Quex Road, West Hampstead, N.W.6.

McPherson, Andrew.—B. 1880. Educ. at Allen Glen's School and the Royal Technical College, Glasgow. Engineering Training with the Electric Construction Co., Ltd., of Wolverhampton. Was appointed Assistant Engineer to the Public Works Department of the Nigerian Government, Chief Engineer of the Nova Empresa Luz Electrica, Maceio, Brazil, and later Engineer and Manager of the Madeira Electric Lighting and Power (1909) Co., Ltd., Funchal, Madiera. Was for some time acting as special Brazilian correspondent to the "Electrical Review." Joined the G.P.O. in connection with the original scheme for the Imperial Wireless Chain, and in 1915 was transferred to the Admiralty in connection with Wireless Telegraphy Engineering. From 1915 to 1917 was engaged in inspecting and reporting on Wireless Telegraphy Stations abroad, visiting practically all Naval Overseas Wireless Telegraph Stations in every part of the world. At present Head of the Wireless Shore Station Division of H.M. Signal School, Portsmouth. Address: 22, Cousin's Grove, Southsea, Hants.

Mesny, Rene.—B. 1874, at Brest. Educ. Lycee de Brest, then Naval School. Naval Officer in 1894. Prof. of Naval Constructions to the Naval School in 1901, then Prof. of Hydrography. During the War appointed to the T.S.F. Radio Service—is specially occupied with Direction-Finding on land and sea. Attached to le Laboratoire de la Radiotélégraphie Militaire. Officer of the Legion of Honour.

Meissner, Alexander, Dr. Eng.—B. Vienna (Austria), 1883. Studied at Technical High School and University, Vienna; became assistant at the Technical High School. Joined the Laboratory of the Telefunken Company, Berlin, 1907, and since that time has taken a very prominent part there in the development of the technique of wireless in Germany, having been responsible for the introduction of the Flat-coil, the most favourable diameter for high frequency coils, musical quenched sparks, timed sparks, Telefunken compass, interference-reception, direct current cathode valve relay for Morse reception, etc. Invented the generation of oscillations with three electrode valves, 1913, as well as the triode, with back coupling for reception by beats. Has published a series of articles on his work in different periodicals. Address: Burg Lauenstein, Ouerfranken.

Minohara, Dr. Eng., Lieut.-Com. (of Ordnance), Tsutomu.—Graduated from the Tokyo Imperial University, 1907. Entered Naval Arsenal of Maizuru and Kure and engaged in the manufacture of electrical equipment for radiotelegraphy, Member of the Wireless Research Laboratory in

the Electrical Department of the Arsenal, 1912. Proceeded to France and Germany to study, 1914. Ordered home in consequence of the outbreak of the Great War, and resumed service at the wireless laboratory. Inspector of *post-bellum* condition of radiotelegraphy amongst the Allied Powers. Returned to Japan, 1918, and assumed service at the wireless laboratory again. Now engaged in the equipment of radiotelegraphy aboard war vessels and construction of high-power land stations at the electro-technical section in the naval department; also employed in the improvement of continuous wave radio apparatus at the laboratory. Appointed to serve in the Department of Communications, 1919, and juror of Patent Office, 1920.

Monckton, C. C. F.—B. Great Malvern, May 8th, 1867. Educ. at Uppingham and Malvern Colleges, and at the Central Technical College of the City Guilds. Employed by the Brush Electrical Engineering Company, from whom he passed to Messrs. Boustead Brothers, of Ceylon. Filled Government appointments in Jamaica and Trinidad. Superintendent of Telegraphs and Telephones to the Government of Fiji, 1911. Censor of telegrams during the war. Superintended the erection of the first Colonial Wireless Stations in the West Indies, 1904. Author "Radiotelegraphy" (1907). Acts in an advisory capacity to the High Commissioner for the Western Pacific with regard to all matters relating to wireless in the territories under that official's jurisdiction. Address: Suva, Fiji Islands.

Montefinale, Commander G. R.—B. 1881. Educ. at Technical Colleges in Italy. Entered Naval Academy, Leghorn, 1899. Officer of the R.N., 1903. First appointment on H.I.M.S. "Andrea Doria," one of the first warships fitted with W/T. Assisted on board these vessels at important experiments in Adriatic and Ionian Seas while Mr. Marconi and Marquis Solari experimented with new receiving devices at Ancona. W/T teacher at the R.N. Telegraphist School, 1908-10. Landed on Benadir coast, 1911, where he took part in erection of high-power Marconi station at Mogadiscio. During the Turkish-Italian war served in the Red Sea flotilla blockading Arabian coasts as W/T officer, Director of Radiotelegraphic service in the Italian Somaliland, 1912-14, visiting the whole region, taking part in all the most important occupations and establishing new wireless links in the boundary zone (Mahaddi-Uen, Iscia Baidoa, etc.). After a period of studies at Leghorn served in the Dreadnought squadron for a long period of the war. In December, 1916, while attached to the Inter-allied staff of Brindisi, sent to Red Sea as Director Erytrea W/T of service. Remained in the Marconi H.P. station of Massawa till the Armistice, co-operating with British authorities in Aden and Egypt to establish new links. Constructed a duplex station at Asmara for metropolitan W/T service. During the summer, 1918, gave a demonstration of long distance reception in Abyssinia. Chief of W/T Laboratory and Department of Spezia, June, 1919. Author of several papers on wireless telegraphy. Active correspondent of various periodicals and reviews. Member of the specialist body of the Italian Navy.

Moreno Quesada, D. Manuel, Lieut.-Com.—B. Madrid, January, 1876. Educ. B.A. Seville University, St. Ferdinand Training School for the Navy, Navy School at Ferrol, Torpedo School for Officers at Cartagena. Electrical engineering course at the Central Technical

College (London University). Commander Spanish Royal Navy. Chief Engineer (Sub-Director, and at present Technical Adviser, of the *Ca Nacional de Telegrafia sin Hilos* Spain). Member of the Spanish Parliament. Associate I.E.E. of Great Britain. Member I.R.E. (Amer.). Contributed articles on subjects of torpedo craft, wireless telegraphy and gyroscopic compasses in *La Revista de Marina* (Navy Review), Madrid. Address: *Ca. Nac. de Telegrafia Sin Hilos*, Madrid.

Moriceau, Gaston, Capitaine (of Colonial Artillery).—B. Doué-la-Fontaine (France), 15th September, 1879. Studied (1900-1902), *Ecole Polytechnique* of Paris. Sub-Lieutenant Colonial Artillery, 1902. Before the war served at the Central Radiotelegraphic Military Establishment. During the war Chief of the Radiotelegraphic Service of French Indo-China (except from May, 1915, to May, 1916, when he served in Society Islands). Technical Adviser in Wireless Telegraphy (since February, 1921), French Colonial Office.

Mullard, S. R., M.B.E.—B. 1884. Educ. Private and London Electrical Engineering Colleges. Apprenticed to London firm of electrical engineers; 1908, Assistant Works Manager *Société Anonyme de Usines Pintsch*. 1910 to 1915, Head of Research Laboratory, Edison & Swan, Ltd. (here developed the "Pointolite" arc lamp). 1916 to 1918, Lieut. R.N.V.R., attached to R.N.A.S. for wireless duties. 1918 to 1919, Capt. R.A.F., Head of Wireless Section Research Laboratory, Imperial College of Science, on behalf of Air Ministry. 1919 to 1920, Research in wireless valve manufacture and development. Contractor to H.M. Government for wireless valves. September, 1920, formed the Mullard Radio Valve Co., Ltd. Appointed Managing Director of the Company. Addresses: Orient House, New Broad Street, E.C.2, and R.A.F. Club.

Nally, Edward Julian.—B. in Philadelphia, April 11th, 1859, and educ. in the Public Schools. Pioneer in different modes of communication in America, having had charge of the first Edison telephone in St. Louis, Missouri, before he had obtained his majority. Started business career as a messenger boy for the Western Union Telegraph Company, in St. Louis, and worked his way up through various steps to the position of Vice-President and General Manager of the Postal Telegraph-Cable Company, which he resigned in 1913 to accept the office of Vice-President and General Manager of the Marconi Wireless Telegraph Company of America. Under his management the first commercial wireless circuit was opened to the public between the United States and Japan, in 1914. During the period of the war commercial wireless service by private companies was interrupted, but immediately upon the return of the stations by the United States Government on March 1st, 1920, he established the first direct commercial wireless circuit between the United States and Great Britain, which was soon followed by similar services to Norway, Germany, and France. Upon the formation of the Radio Corporation of America, in 1919, he was elected President and Director, from which position he resigned in 1922 to become Managing Director of International Relations (R.C.A.). Also President and Director of the Pan-American Wireless Telegraph and Telephone Company and the Wireless Press, Inc. Married Lee Warren Redd, of Lexington, Kentucky, June 10th, 1897. Children, Marylee Nally, Hahn and Edward Julian Nally, Jr. Clubs: Caxton, Brothers of

the Book, Lawyers', Pennsylvania Society, American Irish Historical Society, Friendly Sons of St. Patrick, American Geographical Society, National Geographic Society, Ends of the Earth. Residence: The Trees, Ossining, N.Y. Business address: Woolworth Building, New York.

Navarro y Ortiz, D. Benito, Major, Spanish Royal Engineers.—Chief of the Wireless Service of the Army permanent land stations (1918). In 1913 took charge of the Spanish Army Station of Carabanchel EGC (Madrid), until 1918. Decorated by the Spanish Government with the White Military Cross (December, 1919) for his knowledge and merit in wireless matters. Has contributed largely to the development of wireless telegraphy in Spain.

Nieholls, Lt.-Col., Hon. Frederic, J.P. (1911).—B. England, November 23rd, 1856. Educ. Stuttgart, Germany. Went to Canada 1874. Founder of "Canadian Manufacturer," the then Official Organ and Spokesman of the manufacturing interest in Canada, of which he was editor and proprietor until 1893. Consul for Portugal. President Toronto Press Club, 1890. President Athenæum Club, 1893. Life Member Board of Trade. Hon. Member Canadian Press Association. Member Executive Committee, Canadian Manufacturers' Association. Gazetted Hon. Lieut.-Col., October 17th, 1914. Appointed to Senate January 20th, 1917. President and/or Director of many industrial and electrical concerns. President Marconi Wireless Telegraph Co. of Canada, Ltd. Conservative; Anglican. Clubs: Bankers' Club of America, New York; York, Toronto; Albany; Engineers'; etc., etc. Address: 79, St. George Street, Toronto, Ontario, Canada.

Nicholson, Commander Richard Lindsay, D.S.O., late Royal Navy.—Born in London, 1882. Educ. privately; "Britannia." Entered Royal Navy, 1898. Served as wireless officer on the staff of H.M.S. "Vernon" afterwards in the 2nd and 3rd Divisions of the Home Fleet, subsequently being transferred to the 2nd Division under Lord (then Sir John) Jellicoe. Subsequently qualified for the Naval War Staff, and served on the Admiralty Committee (1914) which revised the Naval wireless telegraph and signal books, etc. In July, 1914, was appointed wireless telegraph officer on Lord Jellicoe's staff, and in September of that year was appointed Fleet wireless telegraph officer of the Grand Fleet, vacating this appointment in February 1917, on being appointed to the Admiralty. While Fleet wireless telegraph officer of the Grand Fleet, Commander Nicholson served on the staff of Lord Jellicoe and then on that of Earl Beattie, and devised and introduced an improved form of wireless procedure for use in the Fleet, which was adopted throughout the Royal Navy and subsequently by the Allied Navies. Present at the battle of Jutland, promoted to Commander R.N., and appointed D.S.O., the wireless telegraph work of the Fleet being specially commended by Lord Jellicoe in his dispatches. Appointed Director of Signal Division of the Naval Staff at the Admiralty in 1917, with the rank of Acting Captain, R.N., and retained this appointment until November, 1919. Retired from the R.N. July, 1920. January, 1921, appointed Director of Wireless Telegraphy under the Government, India. During service as Director of Signals at the Admiralty proposed and carried to fruition the formation of the "Wireless Board" and "Imperial Communications Committee." Has always evinced keen interest in

Imperial Wireless Communications and constantly urged that an efficient organisation in this respect is an essential and pressing need of the Empire. Officer of the Legion of Honour, Commendatore of the Crown of Italy. Address: Director of Wireless, India.

Noble, Sir William.—B. 1861. Educ. Public Schools and Gordon's College, Aberdeen. Commenced his career in Aberdeen Telegraph Office as a telegraphist. In 1893, Engineer for the north-east area of Scotland with headquarters at Aberdeen. In 1897 promoted to Headquarters, London, as First-class Engineer. Subsequently successively Technical Officer, Assistant Superintending Engineer, London, Staff Engineer at Headquarters, Superintending Engineer, London, and in 1912 Assistant-Engineer-in-Chief, succeeding to the premier position in June, 1919. Retired January, 1922. Now Director of General Electric Co., and of British Broadcasting Co. In 1919 the King of the Belgians created him a "Chevalier de l'Ordre de la Couronne" for "constant and generous help" during the war. Knighted June, 1920. Contributed articles to "Encyclopædia Britannica" on Telephony and Telephony, and paper to I.E.E. M.I.E.E., Inst. P.O.E.E. Addresses: Engineers' Club, Royal Automobile Club, and National Liberal Club, The Chase, Blackdown, Leamington Spa, and Magnet House, Kingsway, W.C.2.

Norman, Major the Rt. Hon. Sir Henry, B.A., 1st Bt. cr. 1915, Kt. cr. 1906: M.P. (L) Blackburn since 1910.—B. Leicester, September 19th, 1858. Educ. privately in France; Harvard University (B.A.); Leipzig University. Officer of the Legion of Honour; Commander of Order of the Saviour; Officer of S.S. "Maurice" and "Lazare," and Crown of Belgium. Assistant Postmaster-General, 1910; Chairman War Office Committee on W/T (1912); Member of Committee on National Telegraphic Research and P.O. Telegraph Organisation Committee; Member of British Association Committee of Radiotelegraphic Investigation and of International Committee of Radiotelegraphic Research; Chairman of Imperial Wireless Telegraphy Committee (reported May, 1920); Vice-President of Radio Society of Great Britain; Fellow of Physical Society; Fellow of American Institute of Radio Engineers; Liaison Officer with French Government for Military Inventions; Vice-Chairman Imperial Communications Committee, and Chairman of Wireless Sub-Committee. Addresses: The Corner House, Cowley Street, S.W.1; Honeyhanger, Hindhead, Surrey. Clubs: Reform, Royal Automobile, Ranelagh.

Orme, Major Robert, B.A.—B. at Bray (Ireland), October 20th, 1865. Educ. in Irish schools and graduated B.A. at Trinity College, Dublin. Initiated career by taking up Electrical Engineering under Hugh E. Harrison at Hammond College, and then apprenticed to Anglo-American Brush Company. Since 1900 concentrated chiefly on wireless telegraphy and atmospheric electricity. Granted commission in R.F.C. January, 1915, organised and was given command of the Wireless School, Brooklands, November, 1915. Moved himself and his staff from Brooklands to Biggin Hill in September, 1916, where they were constituted first as the Wireless Testing Park and later as the Experimental Establishment, R.F.C. Address: Hollycroft, East End, Newbury, Berks.

Pannill, Charles Jackson.—B. Petersburg, Va., May 13th, 1879. Entered Navy 1898, Chief Telegraphist of United States Coast Signal Service. Entered service of Professor

Reginald A. Fessenden, 1902. Conducted experiments in radio communication across Hampton Roads. Installed communication by radio between New York and Philadelphia, 1903. Installed first radio outfit on United States battleship. Conducted experiments between stations of General Electric Company at Lynn and Schenectady; also between Brant Rock, Mass., and Machrihanish Bay, Scotland. Holds commercial first-grade license No. 1. Entered service of United Wireless Telegraph Company as Division Superintendent, 1909. Erected shore radio stations on Great Lakes, later in charge of division south of New York. Entered service of Marconi Wireless Telegraph Company of America, 1912. Superintendent, Southern Division. Entered service of United States Government, 1914, as expert radio aid, Naval Radio Service. Promoted to Assistant to Director Naval Communications in charge of commercial radio service, 1917. Now General Manager, Independent Wireless Telegraph Company, New York. Fellow of the Institute of Radio Engineers. Member Washington Society of Engineers, Member of the Geographical Society.

Parker, J. N.—B. July 6th, 1881, in Calcutta. Son of the late Major-General N. F. Parker, of the Bengal Army. Educ. Clifton College and the Royal Indian Engineering College, Coopers Hill. Passed out of the latter institution (1902) with diploma of Associate. Joined Indian Government Telegraph Department. Appointed to Electrical Engineer's Office, Calcutta, January, 1904. Accompanied Mr. M. G. Simpson, then Electrical Engineer-in-Chief, to Burma, February, 1904, to assist in establishing wireless communication with the Andamans. Continued his connection with the Electrical Engineer's Office and the technical side of telegraph work, which included the erection of several of the 30-kw. Marconi stations belonging to the Department. Superintendent Indian Wireless Telegraph Stations, 1914-19. Represented the Post and Telegraph Department at Poona in connection with the erection of the Imperial Chain Station, until work stopped early in 1915. Represented the Indian Post and Telegraph Department in England at the India Stores Depot, 1920-22. A.M.I.E.E. Member of the East Indian United Services Club, 16, St. James Square, Bengal Club, Calcutta, Royal Bombay Yacht Club. Address: Messrs. Grindley & Co., 54, Parliament Street, Whitehall.

Pedersen, P. O.—B. at Sig, near Varde Jutland, June 19th, 1874. Entered Royal Technical College, Copenhagen (1892). Cand. Polytechnic (1897). Chief Engineer of Telegrafonen, Ltd. (Poulsen Patent), 1899-1902. Gold Medal Danish Society of Sciences (1907). Lecturer at the Royal Technical College, Copenhagen, and Professor from 1912. On board of Dansk Telegrafonfabrik (Danish Telegraphone Co., Ltd.), 1903-12, as well as on Elektroteknisk Forening (Electrotechnical Association) from 1910; Chairman from 1916. President Danish Institute of Civil Engineers, 1922. Director of Det Kontinentale Syndikat for Poulsen Radiotelegrafi (Continental Syndicate for Poulsen Radiotelegraphy) from 1911-19. Member of International Electrotechnical Commission. Fellow Inst. of Radio Engineers since 1915. Fellow Am. Inst. Electrical Engineers since 1920, and a Fellow Royal Danish Academy of Science since 1917. Member of the Telephone Commission (1917), of the Control Committee of licensed Telephone Companies, of the Commission on the training of radio operators, and of the Radio Commission of 1920. Technical Adviser in Radio to the Department of Public Works,

1922. Principal of and Professor in the Royal Technical College, Copenhagen. His contributions to electrotechnical literature have been both important and numerous. Amongst those of recent appearance we may enumerate the following: "Om Poulsen-Buens Teori" (Copenhagen, 1917); "On the Theory of the Poulsen Arc" (Proc. Inst. Rad. Eng., New York), 1917; and 1919; "Poulsen-Buens Virkemaade"; *Fysisk Tidsskrift*, Vol. xvii (Copenhagen, 1918); "Den Elektriske Buens Elektroteori" (*Elektrotekniker*, Copenhagen, 1917); "The Lichtenberg Figures" (Copenhagen, 1918); and "Townsend's Teori for Steodonisation" (Copenhagen, 1918). Address: Amalievej 1, Copenhagen, V. Denmark.

Penido, Antonio Nogueira.—B. September 25th, 1864, at Juiz de Fora, Minas Geraes Civil Engineer of the "Escola Polytechnica," of Rio de Janeiro (diploma March, 1886). Was engaged in the construction of the Central Railway of Brazil; the Recife-Caruari Railway, the Sorocabana Railway; "port works of Rio de Janeiro and works at Saneamento of the town of Juiz de Fora. Successively Engineer of Public Works of the State of São Paulo, Chief of Traffic of the Sorocabana Railway, Chief Engineer of the Itapura-Corumbá Railway, and Inspector-General of the Mogyana Railway. Director-General of Brazilian Telegraphs (since 1918).

Péri, T. M., Commandant of Colonial Infantry. Officer of the Legion of Honour. He inaugurated the wireless chain in Indo-China, which comprises fifteen transmitting and receiving and two direction finding stations. During the war he superintended the construction of the high-power radio station at la Doua (Lyons), and on the 21st September, 1914, secured communication with Russia and later with America. Introduced the first C.W. apparatus for aircraft, employing vacuum tubes of his own invention. Co-inventor of the French valve (patented by Péri and Biguet, and subsequently acquired by the Marconi Company). Inventor in France of the resistance coupled amplifier (patent subsequently acquired by the Société Française Radioélectrique), of the electrostatic condenser microphone and of apparatus for protecting radio receiving installations from disturbance by atmospheres. Address: Chef du Service, Radio téléphonique de l'Inde-chine, Hanoi, Tong-king.

Pession, Giuseppe.—B. 1881. Educated at the Royal Naval Academy whence was appointed midshipman in 1902. For two years Director of the Spezia Radiotelegraphic School and for three years teacher of radiotelegraphy at the Rome Military Institute of Radiotelegraphy. Since 1920 Professor of Radiotelegraphy and Naval Magnetism of the Naples Royal Superior Polytechnical School. Member of several commissions dealing with the development and reorganization of the radiotelegraphic services, both in Italy and abroad. To him is due the project and erection of many wireless installations established in Italy and Colonies. Since 1917 Chief of the Wireless Services to the Navy Department (Capt. R.N.) Has many national and foreign decorations. Author of many scientific works, including "Misura corrent nella pratica radio-telegrafica."

Petavel, Sir Joseph Ernest, K.B.E., D.Sc., F.R.S.—B. 1873. Educ. University College, London. Scientific Research at the Royal Institution and at the Davy Faraday Laboratory, 1896-98. John Harling Fellow, Owens College, Manchester.

1900-03. Scientific Manager, Low Temperature Exhibit of the British Royal Commission for the St. Louis Exhibition, 1904. Professor of Engineering and Director of the Whitworth Engineering Laboratories, University of Manchester, 1908-19. At present Director National Physical Laboratory, Teddington. Publications: Papers in the Philosophical Transactions of the Royal Society, "The Philosophical Magazine," "Engineering," etc. Member of Aeronautical Research Committee and other Government Committees connected with Aviation. Member of Committee on Imperial Wireless Scheme. Clubs: Athenæum; Royal Automobile, Primrose Club, London. Address: National Physical Laboratory, Teddington, Middlesex.

Petersen, Hermod.—B. Christiania, 1875. Graduated as electrical engineer at Bergen Technical College, afterwards attending the Polytechnic University at Karlsruhe, Baden. Chief of the Telegraph Schools, 1900-13. One of the pioneers of wireless telegraphic expansion in Norway. Superintended the first radio experiments, 1901. Later on formulated schemes for all wireless land stations along Norwegian coast. Member of the first International Conference on Wireless Telegraphy, Berlin, 1906. Engineer-in-Charge during the erection of a wireless station at Spitzbergen (1911), which communicates with a similar station in the North of Norway. Remained in charge during its first winter. Chief of the Norwegian Wireless Department, 1913. Superintends the land stations. Also Government Wireless Inspector, controlling all the ship stations of Norway. Published a number of technical books for instructional purposes, principally on the subject of telephony and telegraphy, both wired and wireless.

Petit, Gaston Emile.—Electrical Engineer in the French-Postes et Télégraphes; Technical Director of the Compagnie Générale de Radiotélégraphie. B. Paris, 1877. Chief of the Service of Wireless Telegraphy at the French Postes et Télégraphes, 1905-11. Member of the International Conference on Wireless Telegraphy, Berlin, 1906. Consulting Engineer, Cie Générale de T.S.F., and Société Française Radioélectrique. Address: 6, Rue Nansouty, Paris (xive).

Pickard, Greenleaf Whittier.—B. Portland, Me., February 14th, 1877. Educ. Westbrook Seminary, Lawrence Scientific School, Harvard, and Mass. Institute of Technology. Has made a special study of wireless telegraphy and telephony, and has taken out many United States and foreign patents for wireless inventions, among which are the crystal detector and radio compass. Began radio work 1899, at Blue Hill Observatory, Milton, Mass., under a grant from the Smithsonian Institution. Became associated with Harry Shoemaker, 1901. On the engineering staff of the American Telephone and Telegraph Company, 1902-06. Developed a practical system of radiotelephony, obtaining successful speech transmission without wires, 1902. From 1906 until the present date has been connected with the Wireless Specialty Apparatus Company as consulting engineer. Inventor of a method of reducing static interference, which was extensively used by the U.S. Navy for transatlantic reception during the war. Practices extensively as patent expert in wireless patent litigation, and is the author of many papers on radio communication. Fellow of the American Institute of Electrical Engineers. Member of the American Chemical Society. Member of the American Electrochemical Society. Member of the Society of Mechanical

Engineers. Member of the American Institute of Mining and Metallurgical Engineers. Member of the American Meteorological Society. Member of the Society of Chemical Industry. Past President and Fellow of the Institute of Radio Engineers. Club: Engineers'. Private address: Newton Centre, Mass. Office Address: 76, Atherton Street, Jamaica Plain, Mass.

Pletts, John St. Vincent.—B. Ryde, I. of W., 1880. Educ. locally and at Central Technical College. Joined Marconi's Wireless Telegraph Company, Ltd., 1899. Constructed wireless stations in Hawaii, Labrador, the Congo, Russia, and the Far East. Deputy Chief of Staff, 1906. Head of that Company's newly formed Patent Department, 1910. Expert in Cryptography at the War Office, 1914. Consulting Engineer, 1919. Member of various scientific societies, and author of a number of technical articles. Address: Marconi House, W.C.2, and Shalston House, Ewell Road, Surbiton.

Poulsen, Valdemar, Eng., D.Sc., D.Ph (n.c.) Leipzig (1909).—B. Copenhagen, November 23rd, 1869. Studied at University of Copenhagen, 1889-93. Entered technical department Copenhagen Telephone Company, 1893, and for a number of years superintended electrical testing operations. Holds Medal for Merit in gold with crown. Collaborated with Prof. P. O. Pedersen for many years. Member of the board of the Telegrafonen, Ltd. (Poulsen Patent), 1902-16. Joined board of Dansk Telegrafonfabrik, Ltd., 1909, and that of Poulsen Wireless Telephone and Telegraph Company, U.S.A. (1909-11). Fellow of Danish Society of Sciences (1914). Grand Prix at Paris in 1900 for telephone work. Invented in 1903 the arc method of generating continuous electrical waves of wireless frequencies. Danish Society of Sciences' Gold Medal (1907). Publications: "Une Méthode pour Produire des Oscillations non Amorties et leur Emploi dans la Télégraphie sans Fil"; and "La Téléphonie sans Fil"; Rapport Officiel au Congrès International des Applications Electriques, Turin, September, 1911 (Copenhagen, 1912). Address: Gentofte Maltøgardsvej 6, Copenhagen.

Prince, Major, Charles Edmond, O.B.E.—B. Capetown, 1874, son of Rev. E. B. Prince, sometime Vicar of Tor Mohun, Torquay. Educ. Clifton College (Science Exhibitioner) and Faraday House. Married in 1908 Amelia Ella Verner. Published 1905 "Ode on Poetry and other Poems" (Harrison, Pall Mall), etc. Joined Marconi's Wireless Telegraph Company, Ltd., 1907, specialised in Research Work and particularly in Wireless Telephony. Demonstrated first Marconi Field Station in Italy and Switzerland, 1909. Instituted important improvements in Bellini - Tosi Direction Finding System. Granted commission in Westmoreland and Cumberland Yeomanry, 1911. Attached R.F.C., April, 1915. Developed at Brooklands in same year first aircraft wireless telephone. Gazetted experimental officer (First Class), December, 1915. Mentioned in dispatches 1918, and in the same year appointed Major. Granted M.B.E. 1918, O.B.E. (Military Division), 1919. Technical Manager of the Aircraft Department, Marconi's Wireless Telegraph Company, Ltd. Addresses: Stubblings Manor, Burchetts Green, Berks.; 63, Drayton Gardens, London, S.W.

Pupin, Dr. Michael I.—B. Hungary, October 4th, 1858. Went to the United States, 1874. Studied at Colombia University. Graduated 1883. Study continued at Cambridge, England, and Berlin. Returned to the United States. Professor of Mathematical Physics at the

Colombia University, 1891. Among his first original work may be mentioned the development of electrical resonance, before the introduction of wireless telegraphy. Patents issued to him on electrical selectivity were licensed to Marconi's Wireless Telegraph Company, 1903. Director of Research Laboratory, Columbia University, New York, ex-President, Institute of Radio Engineers. Has worked extensively in the development of his inventions in connection with telephones and telegraphs, and many of his improvements are known by his name throughout the world. Has recently been engaged in the development of a new method of electrical selectivity to be used in connection with wireless telegraphy. Has also been engaged in research work in wireless telephony.

Raineri, Biscia Giuseppe.—Commander R. Navy. Educated at the Royal Naval Academy in Leghorn. In 1907, as instructor of radiotelephony took part in the first experiments on radiotelephony. Director of the wireless telegraph services in Eritrea (1911-13). Chief of Wireless Section at the Navy Dept (1916-17), co-operated in the development of c.w. on the Navy's wireless installations and on board merchant vessels. As a representative of the Italian Navy took part in several inter-allied conferences on ordinary and wireless telegraph communications in Central Europe. Member of the Preliminary International Wireless Telegraph Conference in Washington (1920), acting in the same capacity at the Provisional Technical Radiotelegraphic Committee held in Paris, 1921.

Rego, Capt. T. R. Moraes.—B. Rio de Janeiro, March 8th, 1882. Completed training at Naval Academy, 1900. Served for a few years on ships, studying electricity and torpedoes. Torpedo Lieutenant in the Professional Torpedo School. Began studying radiotelegraphy when first wireless stations were installed in Brazilian Navy, 1904. Perfected his knowledge of the subject on special trips to Europe and America. Assistant in the Radio Department of the Navy on various occasions. Appointed (1914) Chief of the Radio Service, Brazilian Navy, a post which he still holds. Address: 22, Ipanema Copacabana, Rio de Janeiro.

Rendahl, R. H.—B. 1878. Electrical engineer in the Royal Swedish Navy Department, 1909; attached to the Swedish Board of Admiralty, 1912: wireless expert attached to the Swedish Navy. Knight of the "Nordstjärna" Order, and holder of several foreign orders. Address: Djursholms, Osby, Sweden.

Reoch, Alexander.—B. Sheffield, England, 1884. Educ. Sheffield Science School and Sheffield University College. Graduated in electrical engineering, 1902, winning the Mappin Medal and Prize in that year. Entered the service of the English Marconi Company in June, 1902, and undertook construction and operating work in England, Holland, Germany, and Egypt. Appointed engineer with the Canadian Marconi Company, 1905, and from 1909 to 1911 in complete charge of the business, during which time that company's contract with the Canadian Government for the operation of the Great Lakes stations was negotiated, as well as the contract between the Canadian Company and the Newfoundland Government. Chief Engineer of the Canadian Marconi Company, 1917, and at the beginning of 1918 he relinquished this position to take an appointment on the engineering staff of the American Marconi Company. Appointed, 1920, Plant Engineer, Radio Corporation of America. Appointed January 1st, 1921, Assistant Chief Engi-

neer Radio Corporation of America. Fellow Institute Radio Engineers. Associate Member Engineering Institute of Canada. Member Franklin Institute of the State of Pennsylvania. Address: 233, Broadway, New York.

Ribeiro, Alvaro Nunes.—B. Lisbon, 1879. Educ. National Lyceum and the Lisbon Polytechnic School. Cadet in the Naval School, 1898. Completing his training there, was commissioned to join an expeditionary force to the Zambesi. On his return to Portugal he was appointed naval instructor at the Torpedo and Electrical School, where he devoted himself to the study of wireless. Leading member of the Naval Commission on Organisation, 1910, where he strongly advocated the establishment of a naval staff for war purposes. Member of Parliament. Member of the Commission on Posts and Telegraphs. Secretary to the Naval Commission. As a member of the Posts and Telegraphs Commission he fathered a Bill for the organisation of Portuguese Colonial Wireless which was passed by Parliament. Commanded the vessels "Berrio" and "Patrao Lopez" engaged in rescue work, when he met with a serious accident trying to save a cruiser. As a consequence returned to shore service, where he organised the Portuguese Coast Service, and formulated a code of regulations. Commander and Director, Radiotelegraphic Station of Monsanto. Address: R Vieira da Silva 64, Lisbon.

Rinde, K. Werner J., Junr.—B. Falun, 1882. Educ. Falun and Göteborg University. Telegraph clerk, controller, etc. Studied W/T and telephony systems and traffic, during voyages to Holland, Great Britain, Germany, Austria, Italy, and U.S.A. 1912-13, spending some months with the Marconi Companies in Rotterdam and at sea. Teacher at W/T school of Royal Swedish Telegraph Board from 1914. Supt. of the W/T station at Vaxholm, Sweden, 1914-16, of Karlsborg Radio since beginning of 1917. Address: Karlsborg, Sweden.

Rivers-Moore, H.R., B.Sc., A.C.C.I.—Educated at Wellington College and London University. Three years apprenticeship George Clark, Ltd., Engineers, Sunderland. Post Office Engineer-in-Chief's Dept., 1907. Delegate to 2nd International Telegraph Conference at Paris, 1910. Appointed to Wireless Section of the Post Office, December, 1910. In 1913 purchased and carried on the business of the Wilson Apparatus Co., manufacturing transformers, Wilson coils, and other Wireless apparatus. In 1916 this business was taken over by the Indo-European Telegraph Co., Ltd., and associated successively with Messrs. Creed & Co., Ltd., Croydon, and Automatic Telephone Co., Ltd., Liverpool. Appointed in 1918 Asst. Physicist at Admiralty Anti-Submarine Dept., Parkstone Quay, and subsequently given the rank of Hon. Capt. Marines. In 1920 organised the firm of "R. M. Radio Ltd.," undertaking the supply and maintenance of Wireless Equipments of all kinds and is Chairman of this Company.

Robinson, James, M.Sc. (Dunelm), Ph.D. (Göttingen).—B. 1884. Educ. University of Durham and University of Göttingen. Pemberton Fellow University of Durham, 1906-09. Lecturer in Physics, University of Durham, 1906-07. Lecturer in Mathematics, Armstrong College, 1909-10. Lecturer and Demonstrator in Physics, University of Sheffield, 1910-12. Lecturer in Physics, East London College, University of London, 1912-15. Examiner in Physics, University of London, 1912-15. Lieut.,

R.N.V.R. for Wireless Duties, 1915-17. Lieut., R.N.V.R., attached R.N.A.S. for Experimental Wireless Duties, 1917-18. Captain R.N.A.S. for similar duties, 1918-20. Chief Experimental Officer, Instrument Design Establishment, Biggin Hill, 1920-22. Head of Department for Wireless and Photography, Royal Aircraft Establishment, Farnborough, 1922. Author of "Dust Figures in Kundt's Tube" (papers in "Physikalische Zeitschrift," Philosophical Magazine, Proceedings of the Physical Society of London, between the years 1908 and 1913). "Absorption of Cathode Rays in Gases" (papers in "Annalen der Physik," Proceedings of the Philosophical Society of the University of Durham, in 1910). "Photoelectric Effect" (papers in the "Philosophical Magazine," 1910-15). Papers on "Directional Wireless and Reception on Aircraft" (in "Radio Review"). Article on Wireless, Dictionary of Physics. Various Patents. F.Inst. P. Fellow Physical Society of London. Member Royal Society of Great Britain. Address: R.A.F. Club, 128, Piccadilly, W.1., or Royal Aircraft Establishment, South Farnborough, Hants.

Robison, Samuel S., Rear-Admiral U.S. Navy.—B. May 10th, 1867. Graduated from the U.S. Naval Academy, 1888. In personal charge of the Division of Radiotelegraphy in the Bureau of Equipment, Navy Department, 1904-06, and in general charge from 1909-11. Author of the "Manual of Wireless Telegraphy for Naval Electricians" first issued in 1906, and revised for several subsequent editions. M.I.R.E. Address: Boston Navy Yard, Boston, U.S.A.

Rodrigues, Apolinio Gomes da Silva, Flag Captain in the Portuguese Navy.—B. May 31st, 1866. Finished education and entered Portuguese Navy in 1886. Became Professor of Electricity and Torpedoes at the Naval College in 1902, and Professor of Electricity of Naval Auxiliary College, 1903. Received his present rank of Flag Captain in 1907. Entrusted with embodiment of Naval Regulations concerning wireless in 1909. Elected Member of Advisory Committee on wireless in the Portuguese Navy in 1910. Address: Portuguese Admiralty, Lisbon.

Rutherford, Sir Ernest, Kt., F.R.S.—B. New Zealand, 1871. Educ. Nelson College, Canterbury College, New Zealand University, Cambridge University. Cavendish Professor of Experimental Physics, Cambridge, and Fellow of Trinity College. 1898-1907, Professor of Physics, McGill University, Montreal. 1907-1919, Professor of Physics, University of Manchester. Nobel Laureate, 1908. Has published many works dealing with the conduction of electricity through gases and radio activity. Address: Lewisham Cottage, Cambridge.

Rydin, Sven Ludvig Hermon.—B. Upsala, October 2nd, 1861. Graduated in Law, Upsala, 1885, solicitor's clerk 1887, Registrar in the Lower House 1888-90, Registrar in the Upper House 1890-97. Auditor attached to the Swedish State Railways 1890-97, Registrar attached to the Board of the State Railways 1895-96, assistant to the Director of the State Railways 1896-97, Member of the Board of Telegraphs 1897-1902, Under Secretary of State for Home Affairs 1902. Since 1905 Director of Telegraphs in Sweden. Grand Commander of the "Nordstjärna" Order and holder of several foreign decorations. Address: Kungl. Telegrafstyrelsen, Stockholm.

Salmond, Captain J. S. C., R.N.—B. 1882. Entered "Britannia," 1897, left 1898. Served

in China in "Barfleur," landed in the Boxer operations, 1900. Mentioned in dispatches. Served in Pacific in "Grafton" and "Flora." Qualified as torpedo lieutenant, 1905. Served in Atlantic in "Antrim" as lieutenant (T.). Served in Wireless Telegraphy Experimental Department, "Vernon," 1908-11. Squadron Wireless Telegraphy Officer, 2nd Battle Squadron in "Hercules," 1911. Fleet Wireless Telegraphy Officer, Home Fleet (later Grand Fleet), in "Neptune" and "Iron Duke," 1912-15. Wireless Telegraphy Assistant to D.N.O. Admiralty, 1915-17. In command of "Odin" in Red Sea, 1917-19, mentioned in dispatches for operations against Turkish forces in the Asir and Yemen. Serving in Signal Division, Admiralty, on Wireless Telegraphy duties. Member of Radio Research Board. Address: Admiralty, London, S.W.1.

Saltmann, Charles McKinley, Brigadier-General—B. 1871, State of Iowa. Started business as railway telegraphist and graduated at West Point, 1896. As cavalry officer took part in the Spanish-American War, 1898. Signal officer during the Insurrection in the Philippine Islands. Transferred to the Signal Corps of the U.S. Army, 1901. Since identified with the electrical cable and radio work, U.S. Army. For a number of years in charge of the electrical Laboratory of the Signal Corps in Washington, where radio equipment of the U.S. Army is designed and tested. In charge of the radio work of the U.S. army on the Panama Canal. Represented the United States at the International Radiotelegraphic Conference of London, 1912. Member of the Inter-Departmental Board which prepared regulations for the control of radiotelegraphy in the U.S.A. Executive officer in the Chief Signalling Office. Address: Office of the Chief Signal Officer, Signal Corps, U.S.A., Washington, D.C.

Sankey, Captain M. P. H. Riall, C.B., C.B.E., R.E. (Ret.)—B. Nenagh, Ireland, 1853. Educ. Switzerland, Royal Military Academy, Woolwich, School of Military Engineering, Chatham. Served in England, at Gibraltar, and as Instructor in Fortification at the Royal Military College, Kingston, Canada. Posted to the British Ordnance Survey, and had charge of the Trigonometrical Division the Electrotyping Department and the Workshops. Retired from the service (1889) to join the Board of Messrs. Willans and Robinson, Ltd., and (1904) took up consulting work. Shortly afterwards joined the Boards of Marconi's Wireless Telegraph Company, Limited, and the Marconi International Marine Communication Company, Limited. Also a Director of several other companies. Served during war as Hon. Engineering Adviser to the Director of Fortifications and Works. Served on the Hon. Valuation Advisory Committee of Experts, dealing with the plant and buildings installed by manufacturing firms for munition purposes. Author of "The Energy Chart," "Practical Application to Reciprocating Steam Engines," part IV of Rimington's "Construction" (anonymously). Translated from German Prof. Ritter's book on "Bridges and Roofs." Contributed numerous papers to I.C.E., I.M.E., I.E.E., Inst. Naval Architects, Royal Society of Arts, Royal Society, etc. etc. Member of the following institutions: Civil Engineers, Mechanical Engineers (President 1920 and 1921), American Mechanical Engineers, Electrical Engineers, Royal Institution of Great Britain, Iron and Steel, Naval Architects, Junior Engineers, and Gas Engineers. Member of the Governing Board of the National Physical Laboratory and of the Wireless Telegraphy

and Gaseous Explosives Committees of the British Association. Address: 57, Castle Bar Road, Ealing, W.3.

Sarnoff, David.—B. in Russia, February, 1891. Entered the United States July, 1900. Started business 1906, and in 1907 received an appointment as Wireless Operator at the Marconi Station located at Siasconset, Nantucket Island, Mass. Served at various ship and shore stations, and eventually became Manager at the Marconi Station at Sea Gate. Has held a number of responsible positions in the service of the Marconi Wireless Telegraph Company of America, being now Commercial Manager of the Radio Corporation of America. Vice-President and Director of the Pan-American Wireless Telegraph and Telephone Company. Secretary of the Institute of Radio Engineers 1915-1917. Author of a paper on Radio Traffic read before the Institute of Radio Engineers, and a number of other papers on wireless telegraphy. Addresses 90, Pinehurst Avenue, and 233, Broadway, New York.

Sayeki, Mitsuru.—B. Japan, 1871. Entered Naval College, 1889. Entered the Electric Technical Laboratory of the Ministry of Communications, 1895. Engaged since 1899 in the investigation of radiotelegraphy. Was connected with "Teishinsho" Radio System, Government and private commercial coast station and commercial ship stations in Japan. Since 1908 Chief Radio Engineer of the Director-General of Japanese Posts and Telegraphs. Awarded prizes and medals for investigation in radio telegraphy. Fellow I.R.E. (Amer.). Address: 23, Kasumicho, Azabu, Tokyo.

Schledermann, Helmuth Joh. Christian.—B. Copenhagen, September 24th, 1876. Educ. Royal Naval Engineering College; Polytechnic Academy of Copenhagen. Further training with electrical firms in foreign countries. Controls the Electrical and Wireless services of the Danish Navy, also Inspector of Danish W/T stations and Electrical and W/T adviser to the Danish Lighthouse Department. Member of the Danish Engineer's Assn., "the International Electro-technical Commission and a Commission dealing with erection of a high-power wireless station in Denmark. Publication: A manual on W/T for the Danish Royal Navy. Knight Dannebrog, Knight Norwegian St. Olav. Address: Taffelbays Alle 11, Hellerup, Denmark.

Schwill, Fr.—B. Strasburg (in Alsace), April 21st, 1875. Started career as member of the German Post and Telegraph Service. Took part in the International Radiotelegraphic Conference at Berlin in 1906. Appointed by the Swiss Federal Government to the International Bureau of the Telegraphic Union to organise and supervise the new Radiotelegraphic section established by the Berlin Conference. Present position, Sub-Director of the International Bureau of the Telegraphic Union at Berne. Address: Bureau International de L'Union Télégraphique, Berne.

Scott-Taggart, John.—Educ. Technical establishments and King's College, London. Two years departmental Manager and Research Engineer, Radio Communication Co., Ltd. Acts as patent adviser to C. F. Elwell, Ltd., and Mullard Radio Valve Co., Ltd., and in a technical advisory capacity to other concerns. Sometime in charge of valve design and construction at Ediswan Lamp Works. Served 1914-1919; sometime Instructor of Wireless to 1st Army, but chiefly Wireless Officer to various units. Mentioned in Dispatches and later awarded

Military Cross. Author of various papers before British Association and other Societies, and of over fifty articles; also the volume "Thermionic Tubes in Radiotelegraphy and Telephony." Fellow of the Institute of Physics and holds membership in the Physical Society and the British, American, and French Institutions of Electrical Engineers; also President of two wireless societies and committee member of Radio Society of Great Britain. Has produced several inventions of commercial importance, particularly in connection with Thermionic Valves. Address: 6, Beattyville Gardens, Ilford.

Shaughnessy, Edward, H., O.B.E.—B. 1871. Engineer-in-charge wireless section, Engineering Department, British Post Office. Entered Post Office Engineering Department, 1896, served in experimental, testing, telegraph, and cable sections, specialising on underground and submarine cables. Served as a cable engineer (1895) on s.s. "Paraday," during the laying of a submarine cable in Gulf of Mexico, and the repair of other cables. After five years in the provinces on construction and maintenance work returned to London (1913) to take up present position. For many years lectured on telegraphy, telephony, etc., at various London Technical Institutes. Member of the Radio Research Board. Post Office representative on Committee of Wireless Section, Institution of Electrical Engineers. Vice-President, Radio Society of Great Britain. Examiner in Telegraphy for the City and Guilds of London Institute. Member of some committees and panels of the British Engineering Standards Association. Address: Engineering Department, General Post Office, London.

Shoenberg, I.—B. 1881. Graduated at the Polytechnic Institute of Kieff. In 1905 joined the Russian Marconi Company on the day of its inauguration, being appointed Chief Engineer. Held this post until 1914, when he left Russia for England, joining Marconi's Wireless Telegraph Company in the capacity of Consulting Engineer. Since 1919 engaged as Chief of Patent Department. Address: Marconi House, Strand, W.C.2.

Simpson, Lt.-Col. Adrian C.M.G. (late) R. E.—B. Edinburgh, 1880. Educ. Clifton and the Royal Military College, Sandhurst. Commissioned in His Majesty's Forces, 1900. Served in India, being transferred to the Regular Indian Army. Visited Russia 1903-5 for linguistic study. Retired 1907. Becoming interested in wireless telegraphy, and started work with the English De Forest Wireless Telegraph Syndicate. His connection with Marconi's Wireless Telegraph Company commenced with his joining the Field Station Department. On the formation of the Russian Company of Wireless Telegraphs and Telephones, 1908, appointed managing director of that company. During the war served in Russia; and at the War Office. Late Director of Wireless Telegraphy under the Government of India. Deputy Managing Director of Marconi's Wireless Telegraph Co. Chevalier of Order of St. Anne, 3rd Degree, and of Order of S. Stanislas, 2nd Degree, with Crossed Swords. Addresses: c/o H. S. King & Co., 9 Pall Mall, S.W., The Naval and Military Club, and Ranelagh.

Sins, Ernest.—B. 1859, Besançon, where he received his early education. Joined the Ecole Polytechnique, and began his career by enrolling in the Corps of Telegraph Engineers. Participated in the organisation of the telegraphic and telephonic systems in Tunisia. Received an appointment in the Central Office of Posts and

Telegraphs, Paris, 1892, where he ultimately rose to the position of Telegraph Engineer-in-Chief. Chief of the Correspondence Department of International Telegraphy, 1899, and took special interest in wireless telegraphy. Represented his country at the International Conferences on Radiotelegraphy held at Berlin, 1903, and acted as Secretary to the Commission appointed by the latter Conference for drawing up regulations. Sub-Director of the French Telegraphic Department, 1911, but resigned from "the public service in the same year in order to be at liberty to take part in the development of wireless industry. One of the founders and directors of the Compagnie Générale Radiotélégraphique, and was afterwards managing director to the Compagnie Universelle de Télégraphie et de Téléphonie sans Fil. Since the beginning of 1918, general manager of the Compagnie Générale de Télégraphie sans Fil.

Slee, Commander J. A., C.B.E., R.N. (Ret.)—B. May, 1878, Wimbledon. Educ. on training ship "Britannia." First appointment, as midshipman was to H.M.S. "Centurion," on which vessel he sailed for China, 1894, being transferred, three years later, to the brig "Nautilus" for sailing experience. Passed for his lieutenant's commission, obtaining four firsts out of a possible five. After service on the "Decoy," "Ernest," "Anson," and "Severn," qualified as Torpedo Lieutenant, and spent a year on the staff of the "Defiance" at Devonport, where he gained his first wireless experience, 1901. Whilst attached to H.M.S. "Queen," 1906, eyesight trouble developed and he was obliged to transfer to shore service. For two years after quitting the sea he served as one of the Wireless Telegraph Experimental Officers on the "Vernon" at Portsmouth, and from 1908 until 1919 was in charge of all shore wireless and war signal stations in Great Britain. Promoted Acting Commander, 1913. Acting Captain, 1918. On the formation of the Wireless Board, Captain Slee was appointed its chief. Awarded an O.B.E., January, 1919. C.B.E., April, 1919. Retired from the Navy due to the eyesight trouble mentioned above, December 1st, 1919, with the rank of Commander. Joined the Marconi International Marine Communication Co. as Technical Superintendent and Adviser, January 1st, 1920. Appointed Technical Manager, M.I.M.C. Co., Ltd., June, 1921. Address: 7, Elvaston Place, London.

Smith-Rose, Reginald Leslie, M.Sc.—B. 1894. Educ. Imperial College of Science and Technology: (a) Royal College of Science, 1912-14; (b) City and Guilds (Engineering) College, 1912-15. Diplomas: Master of Science, London, for Research in Radiotelegraphy; Bachelor of Science, London, First-class Honours; Royal Scholar, Physics, First Place; Associate of Royal College of Science (A.R.C.S.), Class 1, Physics Prizeman. Diplômée of the Imperial College (D.I.C.) for Research Work in Wireless Telegraphy at the City and Guilds (Engineering) College. Practical experience with Messrs. Siemens Bros., Woolwich, from 1915-19, engaged on experimental work in connection with Military, Manual and Automatic Telephones; and latterly with Thermionic Valve Amplifiers for Telephone Lines and Wireless Receiving sets. Now an Assistant at the National Physical Laboratory, engaged on general Radio Research. Member of Sub-Committee "C" on Directional Wireless, of the Radio Research Board of the Department of Scientific and Industrial Research. Physicist-in-Charge of Directional Wireless Research under Sub-Committee "C" of the Radio Research Board. Past Senior Lecturer in

Wireless Telegraphy and Telephony at the Polytechnic, Regent Street, W. Member of Committee of Wireless Section of the Institution of Electrical Engineers. Fellow of Physical Society of London. Member of Radio Society of Great Britain. Author of various scientific papers before I.E.E. and Physical Society, and in "Beama Journal." Address: National Physical Laboratory, Teddington.

Smith, Tom Vincent, Major, M.C.—B. 1872, West Dulwich, London. Joined the Amalgamated Radio Telegraph Company in 1906. Director of the British Radio Telegraph Company. Consulting engineer until outbreak of War. Served on the Civil Aerial Transport Committee, and the Wireless Committee of the Institution of Electrical Engineers. President of the National Association of Supervising Electricians. Papers before the Royal Artillery Institution at Woolwich on "The Co-operation of Aeroplanes with Artillery," and before the British Association on "Aircraft Wireless during War." War Services: Joined No. 1 Reserve Air Squadron at Farnborough, January, 1915. No. 7 Squadron in France, February, 1915. Wireless Officer to No. 3 Squadron in March, and to the 1st Wing in May, 1915. R.F.C. General Headquarters in March, 1916, in charge of R.F.C. Wireless on the Western Front. 1917, Officer-in-Charge of Wireless at the Air Ministry for all theatres of War, 1918, Wireless Officer to the Independent Air Forces until end of War. Decorations: Military Cross, Knight of the Military Order of Savoy, 1914-15 Star, General Service Medal, Victory Medal with oak leaves, King Edward's Coronation Medal, twice mentioned in despatches. Address: Royal Thames Yacht Club, 80, Piccadilly, W. 1.

Snell, Sir John Francis Cleverton, Kt. (Cr. 1914.) B. Saltash, Cornwall, 1869. Educ. Plymouth Grammar School, and King's College, London, 1883. With Messrs. Woodhouse & Rawson, and with Messrs. Crompton & Co., at the Kensington Court and Notting Hill Power Stations, and at Stockholm (Sweden). 1892, Assistant and afterwards Chief Assistant to the late Major-General Webber, C.B., R.E., Consulting Engineer. 1893, Under the late Professor Henry Robinson, as Resident Engineer at King's Road Station, St. Pancras 1896, Borough Electrical and Tramways Engineer, Sunderland. 1906, in private practice as a Consulting Engineer at Westminster 1910, Amalgamated with and became partner of Messrs. Preece, Cardew, Snell and Rider, Consulting Engineers, and during that time acted as principal technical witness for the Crown in the National Telephone Arbitration. 1919, Relinquished partnership and accepted position of Electrical Adviser to the Board of Trade and Chief Electricity Commissioner-designate. 1920, Appointed Chairman of the Electricity Commission. Hon. Commandant of the Engineering Institutions' Volunteer Engineer Corps. One of the original five Trustees appointed by the Army Council to form the Metropolitan Munitions Board. Member of the Nitrogen Products Committee (Ministry of Munitions), and Chairman of the Power Sub-Committee, and member of several other Sub-Committees. Member of the Electrical Trades Committee (Board of Trade). Member of the Electrical Power Supply Committee, (Board of Trade). Chairman of the Water Power Resources Committee (Board of Trade). Chairman of the Electro-Culture Committee (Ministry of Agriculture), and a member of several other Committees. Member of the Advisory Council for Scientific and Industrial

Research. Member of the Imperial Wireless Telegraphy Committee. Member of the Electrification of Railways Advisory Committee. Past Pres. I.E.E. Member of Council I.C.E. Past Pres. Inc. Municipal Elect. Assn. Member Main Committee and Past Chairman of Sectional Elect. Committee of Brit. Eng. Standards Assn. Fellow I.E.E. (Amer.). Fellow Geog. Soc., etc. Contributed: "Distribution of Electrical Energy," 1906 (Spon); "Power House Design," Second Edition, 1921 (Longmans); and many papers read before several Engineering Institutions. Addresses: "Southernway," by St. Martha's, Guildford, Electricity Commission, Gwydyr House, Whitehall, S.W., Junior Carlton, St. Stephens and Royal Fowey Yacht Clubs.

Solari, Marquis Luigi.—Cavaliere Ufficiale della Corona d'Italia, Cavaliere dei SS. Maurizio e Lazzaro, Commendatore di Danilo, and Cavaliere of St. Anna. Received decorations of bronze medals for the campaigns of China and Africa. —B. in Turin. Was appointed officer of the Italian Royal Navy in 1890. Obtained the diploma of Electrical Engineer at the University of Turin in 1898. In 1900 placed in charge of the Laboratory of Wireless Telegraphy at the Royal Dockyard of Spezia. In 1902 took charge of the wireless telegraph station on the Italian warship "Carlo Alberto" during the historic experiments on that vessel conducted by Senator Marconi. In 1903 delegate of the Italian Government to the Berlin Wireless Conference. In 1904-05 supervised the Wireless Telegraph Department of the Italian Ministry of Posts and Telegraphs. Official delegate of the Italian Government at the International Congress of Electricity held at St. Louis, U.S.A., in 1904. Joint inventor with Professor Lori, of the Padua University, of a magnetic relay. Has published several papers on wireless telegraphy in various periodicals and reviews. Since 1906 has devoted himself to the development of the Marconi system in several countries. Address: Via Maria Adelaide, 8, Rome (Italy).

Squier, Major-General Sir George Owen, K.C.M.G., Ph.D.—Educ. Johns Hopkins University, Baltimore. Grad. Doctor of Physics 1893. Research student under the late Professor Rowland and in the laboratory of the late Sir William Preece at the British General Post Office. Discovered the use of living trees as a means of receiving wireless messages 1904, and published a paper entitled "The Absorption of Electro-Magnetic Waves by Living Vegetable Organisms." On June 28th, 1911, a paper by him, dealing with multiplex telephony and telegraphy by means of waves guided by wires was read before the American Institute of Electrical Engineers. Author of numerous papers on the subject of wireless telegraphy and has devoted special attention to the use of wireless telegraphy in military operations. In 1896 the City of Philadelphia, acting on recommendation of the Franklin Institute, awarded him the John Scott Legacy Medal and premium for the polarising photo-chronograph. Awarded the Elliott Cresson Gold Medal for his researches in multiplex telephony, 1912. Presented a paper on "Cable Telegraphy" to the Physical Society of London, June 1915. Author of "Tree Telephony and Telegraphy," "Multiplex Telephony and Telegraphy over Open-circuit Bare Wires Laid in the Earth or Sea," etc. Member of National Academy of Sciences, 1919. Awarded the Franklin Medal, by the Franklin Institute of Philadelphia, Pa., 1919. Awarded the Distinguished Service Medal, United States Army, 1919. In 1919

decorated with the insignia of the Order of Knight Commander of St. Michael and St. George, by Field Marshal Sir Douglas Haig. In 1922 awarded the Italian decoration, Commander of Order of the Crown, Chief Signal Officer U.S. Army. Formerly Military Attaché to the American Embassy in London. Representative of War and State Departments, at the Conference of Interallied Radio Technical Committee, at Paris, France, June-September, 1921. Designated Expert Assistant to American Commissioners representing United States Government at Conference on Limitation of Armament, Washington, 1921. Appointed an ex-officio member representing War Department, of the United States National Committee, International Electrotechnical Commission. Address: War Department, Washington, D.C., U.S.A.

Stanley, Rupert, Principal Municipal College of Technology, Belfast.—B. in Ireland, 1876. Educ. Irish schools and universities. Joined technical staff of the Isle of Thanet Electrical Light and Power Company in 1899, and two years later appointed Lecturer in Physics and Electrical Engineering at the Brighton School of Science and Technology. Returned to Belfast in 1903 as Professor of Physics and Electricity at Belfast Municipal Institute. Principal Municipal College of Technology, Belfast, Professor of Electrotechnics in Queen's University, of Belfast. M.I.E.E. Chevalier of the Legion of Honour. In 1914 undertook the preparation of a "Text-book of Wireless Telegraphy," which has become a standard text-book on the subject, both at home and in America, and is now published in two volumes, of which the second deals exclusively with valves and valve apparatus. Started war service as second in command of a Field Company in the Ulster Division, but was soon transferred to radio-telegraph work, and served in France from October, 1915, to April, 1918, where he became Chief Wireless Instructor to the B.E.F. Address: Municipal College of Technology, Belfast, and The Ulster Club Belfast.

Stone Stone, John.—Studied electricity, chemistry, physics and mathematics at Columbia University and Johns Hopkins University. Experimentalist in research laboratory, American Bell Telephone Company, 1890-99. Made some investigations in telephony without wires. 1892. Consulting Electrical Engineer and expert for the Ladd Wireless Telephone Syndicate, experimenting on directional signalling, 1899. Retained in 1900 by the Stone Wireless Telephone Syndicate, and in 1902 when the Stone Telegraph and Telephone Company was organised. Author of many scientific papers on wireless. Granted more than 100 U.S. patents in the radio field and a correspondingly large number of foreign patents. Fellow American Academy of Arts and Sciences. Fellow American Association for the Advancement of Science, Fellow and Past-President Institute of Radio Engineers. Member or Associate of the following Societies: American Institute of Electrical Engineers; American Electro-Chemical Society; U.S. Navy Institute; Franklin Institute; Mathematics and Physics Club; Boston Scientific Society. His investigations have been principally directed along the lines of eliminating interference in wireless telegraphy.

Swinburne, James, F.R.S.—B. Inverness, February 28th, 1838. Educ. Clifton College. Employed by Messrs. J. W. Swan & Co. (1887) to organise their lamp factory in Paris; later he went on a similar mission to America.

Consulting Engineer since 1894. Member of the Technical Committees considering the Imperial Wireless Scheme, 1912 and 1919-20. Member of various scientific societies, and is on the Council of some. President of the Institution of Electrical Engineers, 1902-3. Addresses: 82, Victoria Street, S.W.1; Woodhurst, Oxted, Surrey.

Swinton, Alan A. Campbell, F.R.S.,—B. Scotland, 1863. Opened career in 1882 at the Armstrong Works, Elswick. Consulting electrical engineer in London since 1887, having been responsible for the carrying out of many large electrical installations. Chairman of Crompton & Co., Ltd., and director of several electricity supply and engineering manufacturing companies. Associated with the development of the Parsons turbine and other important inventions. Chairman of the Council of the Royal Society of Arts; Chairman of the British Scientific Instruments Research Association; a Member of the Executive Committee of the Board of the National Physical Laboratory; Past President of the Röntgen Society. Member of the Executive Committee of British Science Guild; a Manager of the R. Institution of Great Britain (1912-15). Member of Subcommittee "B" on Atmospherics of Radio Research Board of the Department of Scientific and Industrial Research. Past President of the Radio Society of Great Britain. Has devoted considerable attention to scientific research, including wireless telegraphy. Address: 66, Victoria Street, Westminster, S.W.1.

Tafur, D. Jose, Col., Spanish Royal Engineers, Director of the Centro Electrotécnico y de Comunicaciones, Madrid. Has the full control of the Wireless Services in the Spanish Army. A member of the Spanish permanent Radio-telegraph Commission. One of the chief contributors of military as well as civil wireless in Spain.

Tesla, Nikola.—B. Smiljan, Sika, Dalmatia, 1857. Graduated Carlstat, 1873. Went to Gratz, where, at the Polytechnic School, he prepared for work as professor in mathematics and physics. Visited America about 1882, where he captured the attention of the whole world with his fascinating experiments on high-frequency electric currents. Since 1890 devoted himself almost entirely to studies of alternating currents of high frequency and very high potentials.

Thornblad, Thor, Lieut.—B. Upsala, Sweden. 1885. His interest in the theory and practice of wireless dates from 1899. Author of the first Swedish standard work on wireless telegraphy, "Trådlösa Telegrafi" (932 pages), published by P. A. Norstedt & Soeners Förlag, Stockholm, 1911. Passed examination as student at the High School of Stockholm, 1904. Entered the Royal Engineers as cadet, 1904. Commissioned 1906. Studied mathematics, physics and chemistry, 1906-10, first at The Royal Technological Academy of Stockholm, later at the University of Stockholm. By command of the Swedish government, studied wireless telegraphy in foreign countries. Author of a number of articles on radio-telegraphy in the scientific and daily press. Member of the Royal Military Association of Stockholm, the Society the Friends of the Swedish National Museum, the Royal Swedish Yacht Club, etc. Knight of the Order of the Crown of Italy. Address: Strandvägen 7, Stockholm.

Thomson, Sir Joseph John, Kt., O.M., D.Sc. Oxon. (hon.), Dublin, Victoria and Columbia (N.Y.), F.R.S., etc.—B. near Manchester, 1856. Educ. Owen's College; Trinity College, Cambridge. Master of Trinity College, Cambridge, since 1918; Cavendish Professor of Physics, Cambridge, 1884-1918. Has published numerous works, including "Recent Researches in Electricity and Magnetism," 1895; "Discharge of Electricity through Gases," 1897; "Conduction of Electricity through Gases," 1903. Address: Trinity College, Cambridge.

Todd, David Wooster, Captain U.S. Navy.—B. Round Valley, California, June 29th, 1874. Educ. private and public schools in Mich., Nev., and San Francisco. Appointed to Naval Academy, 1891, graduated in June, 1895. Has served at sea on the following vessels of the United States Navy: "Constellation," "Monongahela," "Olympia," "Oregon," "Wheeling," "Rainbow," "Chicago," "Iowa," "Newark," "Denver," "Monterey," "Concord," "Galveston," "Wyoming," "Dixie," and in command of the "Pittsburgh," flagship in European waters; has served ashore as instructor in ordnance, Naval Academy; in charge of Radio Division of Bureau of Steam Engineering, Navy Department, and as Assistant Superintendent of the Radio Service. Attended International Radiotelegraphic Conference, London, 1912, as a delegate. Director Naval Communications, August 3rd, 1916, succeeding Capt. (now Rear-Admiral) W. H. G. Bullard, U.S. Navy. Attended Inter-Allied Radio Conference in Paris upon United States entry into European War, and subsequently organised the American end of the Inter-Allied Transatlantic Radio System. Also organised and directed the United States Cable Censorship, and served on the Censorship Board as Chief Cable Censor. At present Aide to the Commandant, Navy Yard, New York. Address: Navy Yard, New York.

Torikata, Dr. Wichi.—B. Japan, 1883. Trained in Electrical Engineering at the Engineering College of Tokyo Imperial University. Graduated 1906. Devoted himself to the study of Radiotelegraphy and Telephony, acting at one time as Assistant Engineer to Dr. Osuke Asano, ex-Director of the Electro-Technical Laboratory, and also as Chief Engineer of the wireless section. Inventor and patentee of the Koseki or Mineral Detectors, the T.Y.K. Oscillation Gap for use in Radiotelephony, and the Wave Telephony superposed on electric power transmission line. The late Mikado of Japan recognised his services by awarding the Fifth Degree of Decoration, bestowing this honour specifically for services in connection with Wireless Detectors, whilst the Ruling Emperor has presented him with the Fourth Degree of Decoration on account of Radio Researches. The Senate of Tokyo University marked their appreciation by bestowing upon him in 1915 the title of "Dr. Engineer." Has received many prizes for technical work, including the First Medal of the Japanese Electric Engineers' Society (established 1888), and Academy Prize and Medal granted by the Japanese Imperial Academy. After the resignation of Dr. M. Tonegawa, ex-Director, became Director of Electro-Technical Laboratory, Japanese Department of Communications. Address: No. 2801 Sanno, Omori, near Tokyo.

Tosi, Alexandre.—B. 1867. Awarded diploma by the Italian Navy for his electrotechnical works applied to naval science (1889). Together with Dr. E. Bellini, from 1906 to 1911, devoted himself to studying and experimenting upon the

directivity of aerials insulated from earth. In the beginning of 1907 in co-operation with Dr. E. Bellini produced the radiogoniometer which avoids the material rotation of the aerial for directional communications. Together with Dr. E. Bellini was awarded the gold medal by the Italian and Belgian Government for his invention; the same award was obtained at the Brescia Electrical National Fair in 1909, at the Bruxelles International Fair in 1910, and at the Turin National Exhibition in 1911, where the direction apparatus was shown.

Travaillleur, Maurice.—B. Brussels, 1871. Graduated as engineer at Brussels University, 1893. Appointed Electrical Engineer to the late King of the Belgians, 1897. One of the founders of Internationale Société Anonyme, the Marconi International Marine Communication Co., Ltd. Managing Director of the Société Anonyme Internationale de Télégraphie sans Fil, and Chairman of the Société Nationale Radio-électrique, both in Brussels.

Tsiang Tseng-yi.—Native of the Haining District of the Chekiang Province. Acquired the third degree of Literature at the Metropolitan Examination in Peking, 1904, and appointed Junior Clerk of the Board of Revenues. Soon afterwards transferred to the Board of Communications (then known as Yuchuanpu). Proposed that all the commercially and provincially owned telegraph lines be nationalised and placed under the direct control of the Yuchuanpu. This proposal received the approval of the Government, and was put into operation. In 1911, as Commissioner of Telegraphs of the Yuchuanpu, he caused two powerful radio stations to be established, one in Peking and the other at Nankin. He served over ten years in the telegraph service, holding the following positions: 1910-11, Commissioner of Telegraphs of the Yuchuanpu; 1913-16, Chief of the Financial Department of Telegraphs, Posts and Navigation. Acted as Chief of the Telegraph Department and Director-General of Telegraphs of the Ministry of Communications, and Chairman of the Chinese Society of Electrical science.

Turner, Laurence Beddome, M.A.—B. 1886. Educ. Bedford Grammar School and King's College, Cambridge (1904). First class honours in Mechanical Sciences Tripos in 1907. Spent 1907-08 in research work at the C.U. Engineering Laboratory, receiving in 1908 the award of the University "John Winbolt Prize" for an essay on this research. After a year in the workshops and drawing office of Messrs. Siemens Bros. at Woolwich and Siemens u. Halske A.G. at Berlin, entered in 1910 the Engineer-in-Chief's office of the G.P.O. Engaged there in W/T experimental work, and in the design and installation of new ship-and-shore stations. Attached to the Army Signals Experimental Establishment at Woolwich 1916, where he designed wireless field apparatus, including the Infantry "Loop Set." Fellow and Lecturer of King's College, Cambridge, 1919. Member of the Imperial Wireless Telegraphy Committee, 1919. Author of "Outline of Wireless," 1921. Address: King's College, Cambridge.

Turner, Samuel.—Educ. Barrow-in-Furness Sec. and Tech. Coll., under G. Grace, D.Sc., etc. Two years' works training at Messrs. Vickers, Maxim, Barrow. Appointed to post in Telephone Research Labs., London. Subjects included Telephony and Telegraphy, Valves and Valve Circuits, Telephone Transmission,

High-Frequency Measurements, Automatic Telephony, etc. Lecturer and Instructor to R.F.C. W/T Officers at Brooklands (under Major Prince) in W/Telegraphy and Telephony applied to Aircraft December, 1915–Oct., 1917. Research work in W/Telephony C.W., etc. (using Triodes) at R.F.C. W/T Exper. Station, Biggin Hill and Woolwich (1917-18). Transferred to Air Ministry to develop and supervise Technical Section. Resumed civilian research work July, 1919. Inventions: Devices for W/Target Training of Pilots, Observers, etc. Publications: Papers (London Telephone Society). Articles: "Electrician" (and other papers), and I.C.S.; "Textbook on Automatic Telephony, etc. Address: Gothic Cottage, Littlewick, Berks.

Turpain, Professor Albert.—B. La Rochelle, December 2nd, 1867. Employed in the Department of Posts and Telegraphs of France, 1884-87. Licentiate in physical science, 1888. Licentiate in mathematics, 1891. Obtained doctorate of science, 1889. While tutor of physics at the Faculty of Science, Bordeaux, succeeded in sending messages without wires from an equipment erected in the college buildings. Applied himself to the question of tuning and (1899) experimented with a means for determining the direction of electro-magnetic waves. Resumed these experiments 1912. Succeeded in obtaining graphic records of time signals by means of a micro-ammeter over a distance of 300 km. between Poitiers and Paris, 1911. Carried out successful experiments in photographically recording wireless telegraph signals which passed between Paris and Poitiers.

Vallauri, Giancarlo.—B. Rome, 1882. Educ. in the classical schools of Italy. Entered the Royal Naval Academy. Appointed officer of the Royal Italian Navy, 1903. After a few years at sea he quitted the active naval service and joined the Polytechnic School in Naples, obtaining the diploma of engineer and the electro-technic diploma, 1907. Since conducted electrical tuition in the Polytechnic Schools of Padua, Karlsruhe and Naples. Connected with many industrial electric establishments. Inaugurated at the Polytechnic School in Naples a course in Wireless Telegraphy, 1912, and supervised that subject till the end of 1916, with an interruption for service at sea during the first two years of the great war, when he was called to the direction of the Institute of Electricity and Wireless Telegraphy of the Royal Navy by the Royal Naval Academy in Leghorn. Is now also Professor of Electro-technics at the University of Pisa and engaged in supervising the great new station of Coltano-centre. His attention has mainly been turned to the study of ferro-magnetic phenomena, to which he has made important contributions. Has published a series of papers on Ionic Valves, and on radiation measurements. Address: R. Accademia Navale, Leghorn, Italy.

Van der Bijl, Dr. H. J.—B. Pretoria, 1887. Educ. Victoria College, South Africa and Universities of Halle and Leipzig, where he gained his doctorate. Visited the United States in 1913, and joined the Engineering Department of the American Telephone and Telegraph Co. and Western Electric Co. Appointed Scientific and Technical Adviser to the Government of the Union of South Africa, 1920. M.I.R.E., I.E.E. (Amer.), P.S. (Amer.). Among his inventions is the modulation system used successfully by the American Telephone and Telegraph Company in 1915 for wireless telephone communication over a distance of 5,000 miles. Figured prominently in the development of the Thermionic Vacuum Tube, and ranks among the

leading authorities on thermionics. Author of "The Thermionic Vacuum Tube and its Applications," and numerous publications in scientific and technical journals on the vacuum tube and the passage of electricity through ionized liquids, gases, and in high vacuum. Address: 154, New Law Courts, Johannesburg, Union of South Africa.

Van der Pol, Balth, Jun., D.Sc.—B. Jan. 27th, 1889, at Utrecht (Holland). Educ. at Utrecht, graduating as *Candidaat* in the University (1914) and as *Doctorandus* (1916). Studied Experimental and Theoretical Physics, under Professors Julius and Ornstein. His interest in the theory and practice of wireless dates from 1904. Came to England in 1916 to study under Professor J. A. Fleming. Proceeded to Cambridge in 1917, working under Professor Sir J. J. Thomson, at the Cavendish Laboratory for about eighteen months. He is author of a number of monographs upon physical and radiotelegraphic subjects. Appointed Conservator and placed in charge of the physical research laboratory of Teyler's Institute, Haarlem (Holland). In April, 1920, he took his doctor of science degree at the Utrecht University *cum laude* on a thesis on the propagation of electro-magnetic waves through an ionised gas. He is one of the founders of the Dutch Radio Institute, of which society he is vice-president. He is now engaged on research work in the above mentioned laboratory with Professor H. A. Lorentz. Address: 4, Jan Smits-laan, Enidhoven, Holland.

Vanni, Dr. Giuseppe.—B. Albano Laziale (Rome) in 1862. Graduated in science 1887. Went to Strassburg 1890, where, under Professor Kohlrausch, of the Physical Institute, he studied electrical measurements. Appointed to teach physics at the Collegio Romano, Rome, 1894. Nominated professor and director of the physical laboratory of the Military Radiotelegraphic Institute in Rome, 1912. Took part in the International Radiotelegraphic Conference of London, 1912, as a member of the Italian delegation, and also at the Conferences held in Paris in 1912 and 1913. His works are principally concerned with electrodynamics, electrical engineering, and electrical waves. By means of an hydraulic microphone of his invention made interesting experiments in wireless telephony between Rome and Tripoli (1,000 km.) and between Rome and Treviso (420 km.), and in 1914 his paper on the "Progress and Actual State of Wireless Telegraphy and Telephony" gained the Cagnola Prize of the Royal Lombard Institute of Science and Literature in Milan. Address: Rome, Military Radiotelegraphic Institute, Viale Mazzini 10.

Vyvyan, R. N. Educ. Charterhouse. Elect. and Eng. training, Faraday House, 1896-1900. Assistant Engineer. Whitehaven, Burton-on-Trent, Portsmouth and Hammersmith. Joined Marconi's Wireless Telegraph Co., 1900. Built Poldhu Wireless Station, subsequently proceeding to Canada as Managing Engineer until 1908. Built Spanish-American chain of stations. Appointed, in 1910, Superintending Engineer of Marconi's Wireless Telegraph Co. Responsible for design and construction of most of the high-power stations erected by the Marconi Co. Joined R.F.C. 1916, served in France. Later sent to America as member of the British War Mission. Demobilised and returned to Marconi Co. early in 1919 in charge of design construction and management of all wireless stations owned or erected by that company. Addresses: Royal Air Force Club, Royal Automobile Club, and Marconi House, Strand, W.C.2.

Wade, C. F. Newton.—B. Shepton Mallet, Somerset. Five years with Messrs. Siemens Bros. & Co., at Woolwich, as Radio Engineer, during which time he was employed on extensive experiments on earth telegraphy, earthed and buried aërials and transmission of high-frequency currents along wires, in addition to ordinary engineering, designing and testing work in connection with Radio apparatus. Superintendent of Government Radiotelegraphs, British North Borneo, 1918. Postmaster-General and Superintendent of Land Telegraphs in addition in January, 1920. Address: Jesselton, British North Borneo, and Intake, Sheffield, Yorks.

Weagant, Roy A.—B. Morrisburg, Ontario, Canada, 1881. Educ. Stanstead College, Stanstead, Quebec, Canada, and McGill University, Montreal, Canada. Graduated from Electrical Engineering Course, 1905. Studied Physics under Sir Ernest Rutherford and first became interested in wireless through witnessing some of his experiments in Hertzian waves. Gained engineering experience with the Montreal Light Heat, and Power Company, the Westinghouse Electric Manufacturing Company of Pittsburg, Pa., and the De Laval Steam Turbine Company. Took up commercial wireless work in 1908. Entered service of the Marconi Wireless Telegraph Company of America, 1912, where he soon rose to the position of Chief Engineer. Appointed, 1920, Consulting Engineer, Radio Corporation of America. Fellow of the Institute of Radio Engineers and former member of its Board of Directors and Standardisation Committee. Inventor of a novel method of eliminating static interference. Awarded Liebmann Memorial Prize for 1920. Address: Douglas Manor, Long Island, New York.

Whiddington, Richard, M.A., D.Sc.—B. November 25th, 1885, in London. Educ. at St. John's College, Cambridge, where after taking degree in 1908, he undertook research work under Professor Sir J. J. Thomson at the Cavendish Laboratory. Elected Fellow of St. John's College, 1911. In September, 1914, went to Royal Aircraft Factory, Farnborough, to design aircraft wireless apparatus for the Flying Corps. Received first commission in Army in 1915, leaving Farnborough soon after. During the war designed a number of the standard R.A.F. wireless sets and assisted on the W/T Board and Inter-Allied W/T Commission in Paris. Demobilised with rank of major, June, 1919. Has published a number of original papers on various electrical subjects. Member of Sub-Committee "D" on Thermionic Valves, of Radio Research Board, of the Department of Scientific and Industrial Research. Professor of Physics, University of Leeds. Address: Leeds University.

Whitmore, G. Scovell.—B. Dawlish, 1881. Educ. St. Andrew's College, Dublin. Served under Eastern Telegraph Company, Ltd., at Porthcurnow and Malta cable stations. Entered Heaton works of Sir C. A. Parsons & Co., 1902, and became Chief Assistant to the Engr. and Gen. Manager of Northern Counties Electricity Supply Co., Ltd., in 1906. Joined the engineering staff of Marconi's Wireless Telegraph Co., Ltd. (1909), and appointed (1910) Managing Engr. at the Transatlantic W/T Station, Glace Bay, Canada. Since 1912 employed at the head office of Marconi's Wireless Telegraph Co., Ltd., mainly in connection with the construction and maintenance of high power W/T stations, occupying the position of Act. Superintending

Engineer, August, 1916—March, 1919, during absence of the Superintending Engineer on military service.

Wibier, Albert, Lieut.-Col. d'Etat Major.—B. Renaix, 1876. Sent, in 1911, by the King of the Belgians, to install the wireless network in the Belgian Congo. Became Director-General of that service. On returning became Director-General for the construction of new wireless services. Organised and controlled the wireless service of the Belgian Army during the late war. President of the Wireless Commission of the Belgian Aero Club, Member of the Comité National Belge de l'Union Internationale de Radiotélégraphie Scientifique. Address: 11, Rue de la ReINETTE, Brussels, Belgium.

Wien, Professor Max.—B. Königsberg, 1866. Made a special study of the subject of physics under Helmholtz and others, and assisted Röntgen, 1891-93. Devoted considerable attention to the study of electro-magnetic waves and their propagation, and was the originator of the quenched spark.

Wilson, Brig.-Gen. Samuel Herbert, C.B. (1918), C.M.G. (1914).—B. 1873. Entered Army-R.E., 1893. Captain 1904, Major 1913, Bt. Lt., Col. 1916, Bt. Col. 1917. Served S. Africa, 1899-1900 (Queen's Medal with two clasps). Served great war, 1914-18; General Staff Officer, 2nd Grade, 1911-15; General Staff Officer, 1st Grade, 1915-16; Brig.-Gen. General Staff, 1916. Principal Assistant Secretary, Committee of Imperial Defence and Head of Imperial External and Defence Branch Cabinet Secretariat. Secretary Imperial Communications Committee; Wireless Telegraphy Committee; Overseas Defence Committee; Home Ports Defence Committee. Officier Legion d'Honneur; French Croix de Guerre; Commandeur de la Couronne, Belgium; Belgian Croix de Guerre. Address: 22, Stanford Road, Kensington, W.8 (Tel. 5049 Western); and Heath Cottage, Puttenham, Surrey.

Wilson, Ernest.—Educ. the Yorkshire College Leeds. Whitworth Scholarship. Apprenticed to Greenwood & Batley, and Siemens Bros. Professor of Electrical Engineering at King's College. Dean of the Faculty of Engineering, King's College. M.I.C.E., M.I.E.E. M. Wireless Soc., London. Fellow of King's College. Author of "Electrical Traction" (Arnold, 2nd ed.), in collaboration with F. Lydale, B.A., B.Sc. Contributed various papers read before Royal Society, I.E.E., Royal Society of Arts, etc. Holder of Kelvin Prize of the I.E.E. (1921) Addresses: University of London, King's College, W.C.2, and Savile Club.

Wilson, William Hamilton.—B. 1878. Educ. Collegiate School, Wanganui, New Zealand. Apprenticed to Cable & Co., Marine Engineers, Wellington, N.Z. Electrical and mechanical courses at King's College, Strand, London, 1901 to 1904. Assistant Engineer Metropolitan Electrical Supply Co., Ltd., London, 1904 to 1906. Chief Assistant Electrical Engineer, and part-time Acting Electrical Engineer, to East Indian Railway Co., Bengal, India, 1906 to 1908. Electrical Engineer to John Birch & Co., Ltd., London Wall, London 1910 to 1911. Secretary and Director of the Wilson Apparatus Co., Ltd., Carlisle, 1911 to 1913. In private practice since 1913 as Electrical Engineer and Inventor at Kingston Hill. Inventor of various wireless telegraph apparatus, X-ray apparatus, and thermo-electric instruments. Designed some of the earliest transformers and apparatus used for army aircraft wireless, etc., before 1912.

Designed and manufactured transformers, wireless telegraph condensers and transmitting sets used in large numbers during the war by War Office, Admiralty and Royal Air Force, and since then for wireless in the Mercantile Marine. M.I.E.E. M. Röntgen Soc. Joint author of various papers in "The Electrician," on "Measurement of Self Induction, High Tension Discharge Apparatus," etc. Author of paper before Royal Society on "Ruhmkorff Coils," Electrician on "Method for Measurement of Self Induction," Physical Society on "Construction of Thermo-Electric Apparatus," Röntgen Society on "New Generator for X-ray Work." Address: 5-6, Bank Broadway, Kingston Hill, Surrey.

Yagi, Professor Hidetsugu.—B. Osaka, January, 1886. Graduated from the Tokyo Imperial University, 1909. Lecturer and later Professor of Electrical Engineering at the Sendai Higher Technical School. Studied in Dresden, London, and Harvard, 1913-16, engaging at the same time in several researches on radio frequency phenomena. Author of many scientific papers. Professor of Electrical Engineering at the Tohoku Imperial University and Member of the Institute of Radio Engineers.

Yokoyama, Eitaro.—B. 1883. Graduated Engineering College of the Tokyo Imperial University, 1908. Entered Ministry of Communications, Japan. Engaged in radio researches at the Electro-technical Laboratory of the Ministry. One of the inventors of T.Y.K. Oscillation Gaps for Radiotelephony. Awarded the Fifth Degree of Decoration, and granted many prizes for the invention, including the Academy Prize and Medal of Japanese Imperial Academy. Proceeded to America and Europe to study, 1916. Returned

to Japan, 1918, and resumed service at the same Laboratory. Promoted to the Head of the Radio Section of the Laboratory, 1920. M.I.R.E. (America). I.E.E. (Japan). Inst. of Japanese Telephone and Telegraph Engineers. Private address: Kiharayama 1523, Omori, Tokyo.

Zenneck, Professor, Dr. J.—B. April 15th, 1871, in Württemberg. Studied at Tübingen, mathematics and natural history, particularly zoology, 1889-94. Passed the State examination in these subjects, 1894. Obtained his doctorate, 1894. Studied natural history in London and elsewhere. Subsequently devoted himself entirely to physics. Assistant in the Physical Institute in Strassburg, 1895-99. Engaged in making tests with wireless telegraphy in the North Sea, 1899-1900. Assistant Professor of Physics in the Institute of Technology, Dantzic, 1905. Professor of Physics at the Institute of Technology, Brunswick, 1906. Joined the Badische Anilin- and Soda Fabrik, one of the largest chemical works in Germany, 1909. Professor of Physics at the Institute of Technology, Dantzic, 1911, Munich, 1913. During part of the war Technical Adviser to the Atlantic Communication Co., which then operated Sayville wireless station. Member of Bavarian Academy of Sciences. Fellow of the Institute of Radio Engineers. Contributed about 60 papers published in physical and technical journals and relating to various subjects of experimental and theoretical physics, especially electro-magnetic oscillations. Books: 1. "Electromagnetische Schwingungen und drahtlose Telegraphie" 1905; 2. "Lehrbuch der drahtlosen Telegraphie." Of No. 1 there exists a French, of 2 a French and English translation. Address: Technische Hochschule, München (Germany).

OBITUARY.

SINCE we went to press with our last edition, the world of wireless and associated sciences, has had to mourn the loss of two prominent men.

* * * * *

DR. ALEXANDER GRAHAM BELL passed away on the night of August 1st-2nd.

Born at Edinburgh on March 3rd, 1847, he was educated at the High School and the Edinburgh University. Later he went to America and became professor of vocal physiology at Boston University where his studies led him to the invention of the telephone in 1875. He transmitted speech over a long distance for the first time in August, 1876. Dr. Alexander Graham Bell held the Albert Medal of the Royal Society of Arts since 1902, the Hughes Medal of the Royal Society since 1918, and several honorary degrees. The freedom of Edinburgh was conferred upon him in 1920.

MR. L. H. WALTER, late Editor of *Science Abstracts*, and special contributor to the *Electrician*. During his lifetime he was always greatly interested in wireless.

LITERATURE OF WIRELESS TELEGRAPHY AND TELEPHONY

(A) New Radio Books (1922)

(B) Résumé of the More Important
Radio Articles (1922)

(C) Standard Radio Publications

(i) Books.

(ii) Periodicals.

LITERATURE OF WIRELESS TELEGRAPHY AND TELEPHONY

THE literature of Wireless Telegraphy and Telephony increases year by year, and has now reached a stage when only a portion of the volumes and articles published can be recorded. A selection of the more important New Books and Articles published during the past year are recorded below.

(A) NEW RADIO BOOKS (1922).

- Continuous Wave Wireless Telegraphy.** B. E. G. Mittell. [London: *Sir Isaac Pitman & Sons, Ltd.* Pp. 110. Price 2s.]
- Home Radio: How to Make It.** A. Hyatt Vernill. [London: *Harper & Bros.* Pp. 105. Price 3s. 6d.]
- Wireless for the Home.** N. P. Hinton. [London: *Sir I. Pitman & Sons, Ltd.* Pp. 87. Price 2s.]
- Elements of Radio Telephony.** W. C. Ballard, jr. [London: *McGraw-Hill Publishing Co.* Pp. 132.]
- Radio Receiving for Beginners.** R. T. Snodgrass and V. F. Camp. [London: *Macmillan & Co.* Pp. 99. Price 3s. 6d.]
- A Dictionary of Applied Physics.** Edited by Sir R. Glazebrook. 5 Vols. Vol. II., Electricity. [London: Price 63s. net, or £14 14s. the set.]
- The A, B, C of Vacuum Tubes in Radio Reception.** E. H. Lewis. [New York: *The Norman Henry Publishing Co.*, 2, West 45th Street, N.Y. Pp. 132. Price \$1.00.]
- How to make Commercial Type Radio Apparatus.** M. B. Slepser. [New York: *The Norman Henry Publishing Co.*, 2, West 45th Street, N.Y. Pp. 160. Price 75 cents.]
- Radio Telephony for Everyone.** L. M. Cockaday. [New York: *F. A. Stokes Co.* 1922. \$1.5.]
- The Continuous Wave Manual.** J. B. Dow. [San Francisco: *Pacific Radio Publishing Co.* 1922. Price \$1.00.]
- The Complete Radio Book.** R. F. Yates, L. G. Pacent. [New York: *Century Co.* 1922. Price \$2.00.]
- Radio Directory.** Vol. I. [New York: *The Radio Directory & Publishing Co.* Price \$1.00]
- Direction and Position Finding by Wireless.** R. Keen. [London: *The Wireless Press, Ltd.* Pp. 376. Price 9s.]
- Electromagnetic Theory.** O. Heaviside. [London: *Benn Bros., Ltd.* 3 Vols. Reprinted 1922. Price £5 5s.]
- Elementary Text Book on Wireless Vacuum Tubes.** J. Scott-Taggart. [London: *Radio Press, Ltd.* Price 10s.]
- Manuel de Radiotélégraphie Appliquée, a l'usage des electriciens, mécaniciens, monteurs et opérateurs radio-télégraphistes.** J. Brun. [Paris: *Albin Michel*, 22, rue Huygens. 1922. Pp. 430. Price 30 fr.]

- Guide des Candidats a l'emploi d'officier Radiotélégraphiste de la Marine marchande.** J. Brun. [Paris: *Albin Michel*, 22, rue Huygens. Pp. 148. Price 5 fr.]
- La T. S. F. des Amateurs.** F. Duroquier. [Paris: *Masson et Cie.*, 120, Boulevard Saint Germain. Price 12 fr.]
- Methode mnemonique pour apprendre les signaux Morse.** A. Bruyant. [Paris: *Des Forges*, 29, quai des Grands Augustins. Pp. 16. Price 3.75 fr.]
- Les courants alternatifs de haute fréquence.** A. Charbonneau. [Paris: *A. Michel*, 22, rue Huygens. Pp. —. Price 27 frs. 75 c.]
- Le livre de l'amateur de télégraphie sans fils.** J. Roussel. [Paris: *Viubert*. Pp. 304. Price 15 francs.]
- Radiotelefonía española.** R. Y. Sacasa. [Madrid: *El Telegrafo*. Pp. 56. Price 4 pes.]
- Radio Schnell telegraphie.** [Berlin: *Verlag J. Springer*. 1922.]
- Elements of Wireless Telegraphy and Handbook of Wireless Telegraphy.** Commander R. N. Gr. Mezevivis. [Athens: *Government Press*. Pp. 320.]
- Telegrafo senza fili e onde hertziane.** G. Murani. [Milan: *U. Hoepli*. 3rd Edition. Price 10 lire.]
- La telefonia senza fili.** U. Bianchi. [Milan: *U. Hoepli*. Price 10 lire.]
- Radiotelefonía.** D. Ravalico. [Turin: *S. Lattes & Co.* Price 14 lire.]
- Manuale pratico del radiotelegrafista.** G. Della Santa. [Milan: *U. Hoepli*. Price 6.50 lire.]
- Manuale Elementare di Radiotelegrafia dell' Ufficio Marconi.** Sacco and Celloni. [Genoa: *Tipografia "Radio"*. 2nd Edition, Vol. I. Generalità-Oscillazioni smorzate.]
- Misure correnti nella pratica radiotelegrafica.** G. Pession. [Leghorn: *Istituto Elettrotecnico e Radiotelegrafico della R. Marina*.]
- La Telefonia a grande distanza ed i ripetitori telefonici.** Craveri and Demaldè. [Turin: *S. Lattes*. Price 24 lire.]
- Elementi di radiotelegrafia.** Vicedomini and Zambon. [Leghorn: *S. Belforte*.] (Authorised translation of "The Principles underlying Radio Communication," published by the U.S. War Dept.)
- Die Einrichtung von Reichs Funklagen.** P. Münch. (Vol. 54 Post und Telegraphie in Wissenschaft und Praxis.) Dr. Andersch and Dr. H. Herdecker. [Berlin: *Verlag für Politik und Wirtschaft*. 1922. Pp. 72. Price 12 marks.]
- Die Fortschritte der Drahtlosen Telegraphie und ihre physikalischen Grundlagen.** J. Wiesent. [Pp. 36. Price 6 marks.]
- Elektromagnetische Schwingungen und Wellen.** J. Geitler. [Brunswick: *F. Vieweg & Sohn*. 1921. Pp. 218. Price 38 marks.]
- Die Drahtlose Telegraphieren und Fernsprechen mit Hilfe von Kathoden Röhren.** H. Thurn. [Berlin: *R. Dietze*. 1921. Pp. 106. Price 10 marks.]
- In Bannkreis von Nauen.** A. Fürst. [Stuttgart and Berlin: *Deutsche Verlags Anstalt*. Pp. 316. Price 75 marks.]
- Deutsches FunkerjahrBuch für das Jahr 1921.** C. W. Collatz. [Berlin: *F. Gunther & Sohn*; *A.G.* Pp. 160.]
- Von Morse bis Marconi.** A. Neuburger. [Berlin: *Ullstein & Co.* Pp. 241. Price 18 marks.]
- Lehrbuch der drahtlosen Telegraphie und Telephonie.** F. Anderle. [Leipzig and Vienna: *F. Deuticke*. 5th Edition. Pp. 275.]
- Die Drahtlose Telegraphie und Telephonie.** P. Lertes. [Dresden and Leipzig: *T. Steinkopff*. 1922. Pp. 152. Price 78 marks.]
- Drahtloser Übersee Verkehr.** G. Eichhorn. [Zurich: *T. Schöpp & Cie.* Pp. 69. Price 7 fr.]

(B) RÉSUMÉ OF THE MORE IMPORTANT RADIO ARTICLES PUBLISHED IN 1922

RADIO FREQUENCY MEASUREMENTS AND THEORY.

- Resistance and Capacity of Coils at Radio Frequencies.** J. H. Morecroft. [*Proceedings of the Institute of Radio Engineers*, 10, p. 261, August, 1922.]
- Self Oscillating Coupled Systems.** F. Harms. [*Annalen der Physik*, 66, p. 25, October, 1921.]
- Resonance and Damping in the Case of Imperfect Self-Excitation.** H. Pauli. [*Jahrbuch der drahtlose Telegraphie*, 19, p. 42, January, 1922.]
- Determination of the Decrement of a Distant Station by means of a Coil Aerial.** J. Erskine Murray and B. Williams. [*Journal of the Institution of Electrical Engineers*, 60, p. 347, March, 1922.]
- Sensitive Method of Determining the Frequency and Amplitude of High Frequency Oscillations.** J. J. Dowling and J. J. McHenry. [*Electrician*, 87, p. 675, November 25th, 1921.]
- The Damping of Two Electrostatically Coupled Circuits.** W. Grosser. [*Archiv für Elektrotechnik*, 10, p. 257, November, 1921.]
- Self Inductance of Solenoids of Rectangular Shape.** A. Esau. [*Jahrbuch der drahtlose Telegraphie*, 18, p. 453, December, 1921.]
- The Distributed Capacity of Inductance Coils.** G. Breit. [*Physical Review*, 18, p. 133, August, 1921.]
- Diffraction of Plane Electromagnetic Waves by a Perfectly Reflecting Sphere.** F. P. White. [*Proceedings of the Royal Society*, 100, p. 505, February, 1922.]
- On Oscillation Circuits with Iron Core Coils.** H. Schunck and J. Zenneck. [*Jahrbuch der drahtlose Telegraphie*, 19, p. 170, March, 1922.]
- Atmospheric Disturbances from Observations with a Wireless Receiver at the Königstuhl, near Heidelberg.** F. Wolf. [*Jahrbuch der drahtlose Telegraphie*, 19, p. 289, April, 1922.]
- Radiotelegraphy.** G. Marconi. [*Journal of the American Institute of Electrical Engineers*, p. 561, August, 1922.]
- Decoupling of Electrical Systems.** Nv. Korshenewsky and M. Wien. [*Jahrbuch der drahtlose Telegraphie*, 19, p. 356, June, 1922.]
- Standard Wavemeter of the Bureau of Standards (Type R 70 B).** R. T. Cox. [*Optical Society of America Journal*, 6, p. 162, March, 1922.]
- The Field Radiated from Two Horizontal Coils. Aeroplane Landing aided by Wireless Signals.** G. Breit. [*Bureau of Standards Bulletin*, 17, p. 589, 1922.]
- The Effective Self Capacity Inductance and Resistance of Coils.** G. W. O. Howe. [*Journal of the Institution of Electrical Engineers*, 60, p. 67, November, 1921.]
- An Investigation of Transmitting Aerial Resistances.** T. L. Eckersley. [*Journal of the Institution of Electrical Engineers*, 60, p. 581, May, 1922.]
- On the Earth Resistance of Aerials.** A. Meissner. [*Jahrbuch der drahtlose Telegraphie*, 18, p. 322, November, 1921.]
- The Piezo Electric Resonator.** W. G. Cady. [*Proceedings of the Institute of Radio Engineers*, 10, p. 83, April, 1922.]
- Piezo Electric Methods for Generating Electrical Oscillations of Constant Frequency.** W. G. Cady. [*Physical Review*, 19, p. 381, April, 1922.]
- Capacity and Eddy Current Effects in Inductometers.** S. Butterworth. [*Proceedings of the Physical Society of London*, 33, p. 312, August, 1921.]
- Eddy Current Losses in Cylindrical Conductors. A.C. Resistance of Short Coils.** S. Butterworth. [*Royal Society of Philosophical Transactions*, 222, p. 57, September, 1921.]
- Effective Capacity of Multilayer Coils with Square and Circular Section.** G. Breit. [*Philosophical Magazine*, 43, p. 963, May, 1922.]

TRANSMITTING APPARATUS.

- Radio Telegraphy.** G. Marconi. [*Proceedings of the Institute of Radio Engineers*, 10, p. 215, August, 1922.]
- Theory of Arc Generators of H.F. Currents.** E. Mayer. [*Zeitschrift für Technik Physik*, 2, pp. 18, 40, 73 and 94.]
- Earthing Resistance of Antenna.** A. Meissner. [*Jahrbuch der drahtlose Telegraphie*, 18, p. 322, November, 1921.]
- High Speed Wireless Telegraphy.** A. G. T. Cusins. [*Journal of the Institution of Electrical Engineers*, 60, p. 245, February, 1922.]
- An Investigation of Transmitting Aerial Resistances.** T. L. Eckersley. [*Journal of the Institution of Electrical Engineers*, 60, p. 581, May, 1922.]
- Static Frequency Multiplier for the Commercial Production of Very High Frequencies in Wireless Telegraphy.** M. Latour. [*Revue Générale de l'Electricité*, 11, p. 961, July, 1922.]

RADIO INSTALLATIONS (INCLUDING DIRECTION FINDING).

- New York Radio Central Station.** [*Radio Review*, 3, p. 3, January, 1922.]
- The Radio Centre of Saint Assize.** G. Malgom and M. Adam. [*Revue Générale de l'Electricité*, 12, p. 169, August 5th, 1922. *Radio-électricité*, 3, p. 284, July, 1922.]
- Opening of the New Long Island Station of the Radio Corporation of America.** [*General Electric Review*, 25, p. 53, January, 1922. *Radio Review*, 3, p. 2, January, 1922. *Wireless World*, 9, p. 711, February 18th, 1922.]
- The Radio Direction Finder and its Application to Navigation.** F. W. Kolster and F. W. Dunmore. [*Scientific Papers Bureau of Standards*, 428, January, 1922.]

RADIOTELEPHONY.

- Operation of the Modulator Tube in Radiotelephony.** E. S. Purington. [*Scientific Papers Bureau of Standards*, 243, p. 377, 1921.]
- Some Experiments in Radio Telephony.** G. Pession. [*The Wireless World and Radio Review*, 10, p. 164, May, 1922.]
- Analysis of the Energy Distribution in Speech.** L. B. Crandall and D. Mackenzie. [*Physical Review*, 19, p. 231, March, 1922.]

RECEIVING APPARATUS.

- The Recording of High Speed Signals in Radio Telegraphy.** J. Weinberger. [*Proceedings of the Institute of Radio Engineering*, 10, p. 176, June, 1922.]
- A Visual and Photographic Device for Recording Wireless Signals.** C. A. Hoxie. [*Proceedings of the Institute of Radio Engineers*, 9, p. 506, December, 1921.]
- A Telephone with increased Sensitivity.** G. Seibt. [*Elektrotechnische Zeitschrift*, 43, p. 269, 1922. *Jahrbuch der drahtlose Telegraphie*, 19, p. 315.]
- New Viewpoint on the Telephone and its Efficiency.** H. Hecht. [*Zeitschrift für Technik Physik*, 3, No. 2, p. 46, 1922.]
- On the Theory of Differential Receiving Systems.** J. Bethenod. [*Radio-électricité*, 3, p. 55, 1922.]
- Notes on the Design of Radio Frequency. Interval Amplifier Transformers using Iron Cores.** A. S. Blatterman. [*The Wireless World and Radio Review*, 10, pp. 48, 78, 104, April, 1922.]

VALVES AND VALVE APPARATUS (INCLUDING AMPLIFIERS).

- The Development of Tube Transmitters by the Telefunken Company.** A Meissner. [*Proceedings of the Institute of Radio Engineers*, 10, p. 3, February, 1922.]
- A New Rectifier.** V. Bush and C. G. Smith. [*Proceedings of the Institute of Radio Engineers*, 10, p. 41, February, 1922.]
- Some Recent Developments of Regenerative Circuits.** E. H. Armstrong. [*Proceedings of the Institute of Radio Engineers*, 10, p. 244, August, 1922.]
- Naval Vacuum Tube Transmitters.** T. Johnson, jr. [*Proceedings of the Institute of Radio Engineers*, 9, p. 381, October, 1921.]
- The Frequency Jump of Valve Transmitters with Electrostatic Coupling.** W. Grosser. [*Archiv für Elektrotechnik*, 10, p. 317, December, 1921.]
- The Vacuum Valve and its Technical Applications.** H. Barkhausen. [*Jahrbuch der drahtlose Telegraphie*, 18, p. 402, December, 1921.]
- On a Type of Oscillation Hysteresis in a Simple Triode Generator.** E. V. Appleton and B. van der Pol. [*Philosophical Magazine*, 43, p. 177, January, 1922.]
- Design of Radio Frequency Intervalve Transformers Using Iron Cores.** A. S. Blatterman. [*The Wireless World and Radio Review*, 10, pp. 48, 78, 104, April, 1922.]
- The Thermionic Triode as Rectifier.** E. B. Moullin and L. B. Turner. [*Journal of the Institution of Electrical Engineers*, 60, p. 706, June, 1922.]
- An Electron Tube Transmitter of Completely Modulated Waves.** L. M. Hull. [*Scientific Papers Bureau of Standards*, No. 381.]
- Oscillation Hysteresis in a Triode Generator with Two Degrees of Freedom.** B. van der Pol, jr. [*Philosophical Magazine*, 43, p. 700, April, 1922.]
- Effect of Pressure and Gas Content on the Action of Vacuum Tube Detectors.** H. A. Brown and C. T. Knipp. [*Physical Review*, 19, p. 278, March, 1922.]
- Curve Form and Phase of the Oscillations in Valve Transmitters.** E. Alberti and G. Zickner. [*Jahrbuch der drahtlose Telegraphie*, 19, p. 2, January, 1922.]
- The Magnetron.** A. W. Hull. [*Journal of the American Institution of Electrical Engineers*, 40, p. 715, September, 1921.]
- Magnetic Control of Thermionic Emission from a Wire by Current in the Wire : Magnetron.** A. W. Hull. [*Physical Review*, 19, p. 533, May, 1921.]
- On the Influence of Low Frequency on an Electron Relay Generator.** E. Mauz and J. Zenneck. [*Jahrbuch der drahtlose Telegraphie*, 19, p. 256, April, 1922.]
- The Disappearance of Gas in the Electric Discharge.** Research Staff General Electric Co. [*Philosophical Magazine*, 40, p. 585, November, 1920, 41, p. 685, May, 1921, 42, pp. 227 and 914, August, 1921, and May, 1922.]
- The Effect of Absorbed Gas on the Conductivity of Glass.** V. Bush and L. H. Connell. [*Journal of the Franklin Institute*, 194, p. 231, August, 1922.]
- Resistance Amplifiers.** L. Brillouin. [*L'Onde Electrique*, 1, pp. 7, 101.]
- Short Electric Waves obtained by Valves.** E. W. B. Gill and J. H. Morrell. [*Philosophical Magazine*, 44, p. 161, July, 1922.]
- On the Electromagnetic Screening of a Triode Oscillator.** R. L. Smith Rose. [*Proceedings of the Physical Society of London*, 34, p. 127, June, 1922.]

CARRIER CURRENT TELEGRAPHY AND TELEPHONY (WIRED WIRELESS.)

- Wireless Communication between Power Stations and Sub-Stations.** G. von Arco. [*Electrician*, 87, p. 205, August 12th, 1921.]
- High Frequency Telephony : Application to Telephonic Communication by High-Tension Networks.** M. Latour. [*Revue Générale de l'Electricité*, 10, p. 675, November 12th, 1921.] -

(C) STANDARD RADIO PUBLICATIONS
and Subjects intimately connected with Wireless
Research and Development.

(1) BOOKS.

NOTE.—All Books marked with an asterisk (*) are notified by the Publishers as temporarily out of print. Copies of all other Books and Periodicals may be obtained from the Mail Order Department, THE WIRELESS PRESS, LTD., 12-13, Henrietta Street, London, W.C.2.

In cases where the names of two publishers in different countries are quoted against any particular book, the one placed first indicates the country in which the book was first published.

BELGIUM.

- *Aperçu sur la Télégraphie sans Fils en Belgique. Paul Dubois. [Liège : Imprimerie La Meuse. Pp. 120.]
- *A Propos de Télégraphie sans Fils (La Loi du 8 Juillet 1908, et les Signaux FL). M. L. Vandevyver. [Ghent : H. Rousseuw. 1912. Pp. 20. Price 2 fr.]
- *De l'Emploi des Appareils de Télégraphie sans Fil pour l'Observation des Courants Atmosphériques dans les Régions Polaires. A. Boutquin. [Brussels : Veuve Ferd. Larcier. 1907. Pp. 16. Price 0.75 fr.]
- *La Captation ou la Reception des ondes Hertziennes. A. Boutquin. [Brussels : Veuve Ferd. Larcier. 1913. Pp. 13. Price 1 fr.]
- *La Télégraphie sans Fil à Travers les Ages. M. Pierard. [Brussels University.]
- La Télégraphie sans Fil au Congo Belge. R. B. Goldschmidt and R. Braillard. [Brussels : M. Hayez. Pp. 120.]
- *Secret de la Correspondance et Monopole radiotélégraphiques. M. L. Vandevyver. [Ghent : H. Rousseuw. 1913. Pp. 26. Price 2 fr.]
- *Télégraphie sans Fil. L. van Aerschodt. [Brussels : Veuve Ferd. Larcier. 1913. Pp. 27. Price 0.50 fr.]
- *Télégraphie sans Fil Appliquée à la Météorologie aux Previsions du Temps et à l'étude de la Physique du Globe. A. Boutquin. [Brussels : Veuve Ferd. Larcier. 1911. Pp. 40. Price 1 fr.]
- *Télégraphie sans Fil et la Téléphonie sans Fil. F. Fontaine. [Liège : Imprimerie La Meuse. 1911. Pp. 115. Price 3 fr.]

BRAZIL.

- Radiotelegraphia e sua applicacao no Brasil. Francisco Bhering.
- Radiotelegraphia no Brasil. Francisco Bhering. [Imprensa Nacional. 1914. Pp. 341.]
- Telegraphia sem fio. Francisco Bhering. [Typographia Nacional. 1914. Pp. 101.]
- Telegraphia sem fio e seus ultimos melhoramentos. Francisco Bhering. [Typographia Nacional. 1908. Pp. 52.]
- Telegraphia sem fio e Cartographos Conferencia. Francisco Bhering. [Typographia Esperanca. 1914.]
- Telegrapho sem fio. Ricardo Frederico de Lima. [Rio de Janeiro : Officina Typographica da Escola Gerson.]

DENMARK.

- Laerebog i traadlos Telegrafi. O. Lund Johansen. [Copenhagen K.: G. E. C. Gad, Vimmelskiftet, 32. Price 11.00 kr.]
- Moderne Radiomodlagere Elektronrørets Teori og Anvendelse. [Copenhagen K.: G. E. C. Gad, Vimmelskiftet, 32. Price 3.00 kr.]

FRANCE.

- ABC de T.S.F.** [Paris: S.T.M., 57, Rue de Vanves. 1921. Pp. 35. Price 3.50 fr.]
- Appareils et Installations Télégraphiques.** E. Montoriol, with a Preface by M. Blondel. [Paris: Librairie J. B. Baillière et Fils. 1921. Pp. 625, with 440 figures. Price 40 fr.]
- Applications de la Télégraphie sans Fil.** E. Rothé. [Paris: Librairie Beger-Levauult, 5-7, Rue des Beaux-Arts. Fourth edition. 1918. Price 6.80 fr.]
- Applications de la Télégraphie sans Fil.** P. Jégou. [Paris: Librairie Desforges 29, Quai des Grands-Augustins. Pp. 70. Price 2.25 fr.]
- *Carnet d'Enregistrement des Dépêches Météorologiques transmises par Télégraphie sans Fil.** [Paris: A. Michel, 22, Rue Huyghens. 2nd edition. Price 1 fr.]
- Cours Élémentaire de Télégraphie sans Fil.** G. Viard. [Paris: Librairie de l'Enseignement Technique. 3, Rue Thénard. 1918. Pp. 300. Price 15 fr.]
- Cours Technique du Centre d'Instruction pour Élèves-Officiers Radiotélégraphistes.** [Paris: Imprimerie Nationale. 1918. Pp. 180+336+209.]
- Éléments de Télégraphie sans Fil Pratique.** F. Duroquier. [Paris: Dunod, 47-49, Quai des Grands-Augustins. 2nd edition. 1920. Pp. 130. Price 7 fr.]
- Étude de quelques Problèmes de Radiotélégraphie.** H. de Bellescize. [Paris: Gauthier-Villars et Cie., 55, Quai des Grands-Augustins. Pp. 174. Price 16 fr.]
- Introduction à la Théorie des Courants Téléphoniques et de la Radiotélégraphie.** J. B. Pomey. [Paris: Gauthier-Villars et Cie., 55, Quai des Grands-Augustins. Pp. xiv+510. Price 50 fr.]
- La direction des Avions par Télégraphie sans Fil.** M. Percheron. [Paris: Librairie Ernest Leroux. Pp. 60. Price 2 fr.]
- La Mémoire instantanée des signaux Morse.** Hausser. [Paris: Etienne Chiron, 40, Rue de Seine. 1921. Price 6 fr.]
- La Théorie et la Pratique des Radiocommunications. Vol. I. Introduction à l'Étude des Radiocommunications.** Léon Bouthillon. [Paris: Librairie Delagrave. 1919. Pp. ix+193. Price 20 fr., or 28 fr. cloth.]
- La Théorie et la Pratique des Radiocommunications—Vol. II. La Propagation des Ondes Électromagnétiques à la Surface de la Terre.** Léon Bouthillon. [Paris: Librairie Delagrave. 1921. Pp. xv+340, with 133 figures. Price 20 fr.]
- Les Applications de la Physique pendant la Guerre.** H. Vigneron. [Paris: Masson et Cie, 120, Boulevard Saint-Germain. Pp. viii+322. Price 7 fr. net.]
- Les Tubes à Vide en Radiotélégraphie.** P. Dapsence. [Paris XIe: G. Péricaud, 85, Boulevard Voltaire. Second edition. 1921. Pp. 49. Price 2.50 fr.]
- Lexique Technique Anglais-Français.** Lieut. G. Malgorn, in collaboration with M. Desmarests. [Paris: Gauthier-Villars et Cie., 55, Quai des Grands-Augustins. 1920. Pp. xxi+216. Price 10 fr.]
- Livre de l'Amateur de T.S.F.** Joseph Roussel. [Paris: Vuibert, 63, Boulevard Saint-Germain. 1921. Pp. 304. Price 15 fr.]
- Longueurs d'Onde et Propagation.** M. Vieillard. [Paris: Gauthier-Villars et Cie., 55, Quai des Grands-Augustins. 1921. Pp. xii+416. Price 55 fr.]
- Manuel Élémentaire de Télégraphie sans Fil.** C. Tissot. [Paris: Augustin Challamel, 17, Rue Jacob. 1918. Price 12 fr.]
- Manuel pratique de Télégraphie sans Fil.** L. Berranger. [Paris: Etienne Chiron, 40, Rue de Seine. 1921. Pp. 110, with 53 figures. Price 3 fr.]
- Manuel théorique et pratique de Télégraphie sans Fil terrestre et Maritime.** J. Galopin. [Paris: Bernard Tignol, 53 bis, Quai des Grands-Augustins. Second edition. 1919. Pp. vii+366. Price 9 fr.]

- Mémoire facile de l'induction entre spires.** P. Dapsence. [Paris XIe: G. Péricaud, 85, Boulevard Voltaire. Price 0.50 fr.]
- Notions Élémentaires de Télégraphie sans Fil et Construction pratique de Postes Récepteurs.** Jean Rémaur. [Paris: Librairie Desforges, 29, Quai des Grands-Augustins. 1921. Pp. 116. Price 7.50 fr.]
- Notions Élémentaires et Pratiques de T.S.F. A l'usage des personnes voulant recevoir les signaux horaires et les dépêches météorologiques de la Tour Eiffel.** E. Baudran. [Paris: L. Geisler, 1, Rue de Médicis. Price 3.75 fr.]
- Notions générales sur la Radiotélégraphie et la Radiotéléphonie.** R. de Valbreuze. [Paris: La Lumière Electrique, 142, rue de Rennes. Sixth edition. 1914. Pp. 475. Price 15 fr.]
- Nouveau Traité Pratique de T.S.F.** P. le Graverend. [Paris, XIe: G. Péricaud, 85, Boulevard Voltaire. Eighth edition. Pp. 80. Price 2 fr.]
- Oscillations Électriques (Principes de la Télégraphie sans Fil).** C. Tissot. [Paris, VIe: Gaston Doin, 8, Place de l'Odéon. Second edition.]
- Oscillations Electro-magnétiques et la Télégraphie sans Fil.** J. Zenneck. Translated from the German by Blanchin, Guérard et Picot. [Paris: Gauthier-Villars et Cie, 55, Quai des Grands-Augustins. 2 vols. Price 34 fr. each.]
- Précis de Télégraphie sans Fil.** J. Zenneck. Translated from the German by Blanchin, Guérard et Picot. [Paris: Gauthier-Villars et Cie., 55, Quai des Grands-Augustins. Price 24 fr.]
- Premières Notions de Télégraphie et de Téléphonie sans Fil.** Bégébé. [Paris: Bibliothèque Omnia, 20, rue Duret. Pp. 96. Price 4 fr.]
- Principes Élémentaire de Télégraphie sans Fil.** R. D. Bangay. [London: The Wireless Press, Ltd., 12-13, Henrietta Street, W.C.2. Pp. xii+249. Price 9s.]
- Radiotélégraphie, Notions et Conseils Pratiques.** M. Magny. [Paris: A. Michel, 22, Rue Huyghens. Price 2 fr.]
- Radiotélégraphie Pratique et Radiotéléphonie.** P. Maurer. [Paris: Dunod, 47-49, Quai des Grands-Augustins. 1920. Pp. 386. Price 21 fr.]
- Réception des Signaux Horaires Radiotélégraphiques.** Bureau des Longitudes. [Paris: Gauthier-Villars et Cie, 55, Quai des Grands-Augustins. Second edition. Price 5.50 fr.]
- Relais et Amplificateurs.** Paul Dapsence. [Paris: Avenir de la T.S.F., 18, rue Caffarelli. Pp. 16. Price 0.60 fr.]
- Signaux Horaires et Radiotélégrammes Météorologiques transmis chaque jour par la Tour Eiffel.** [Paris: Gauthier-Villars et Cie., 55, Quai des Grands Augustins. Price 2.50 fr.]
- Technique de la Radiotélégraphie.** Rein. [Paris: Gauthier-Villars et Cie., 55, Quai des Grands-Augustins. Price 18 fr.]
- Télégraphie sans Fil, Applications Pratiques des Ondes Électriques.** A. Turpain. [Paris: Gauthier-Villars et Cie., 55, Quai des Grands-Augusins. Second edition, 1908. Price 24 fr.]
- Télégraphie sans Fil.** Berget. [Paris: Hachette, 79, Boulevard Saint-Germain. Price 5 fr.]
- Télégraphie sans Fil.** André Broca. [Paris: Gauthier-Villars et Cie., 55, Quai des Grands-Augustins. Second edition. Price 8.00 fr.]
- Télégraphie sans Fil.** Jean Laurent. [Paris: Henri Gautier, 55, Quai des Grands-Augustins. Pp. 36. Price 0.15 fr.]
- Télégraphie sans Fil.** Lucien Fournier. [Paris: Garnier frères, 6, rue des Saints-Pères. 1912. Pp. 193. Price 2 fr.]
- Télégraphie sans Fil.** E. Coustet. [Paris: Charles Mendel, 118, Rue d'Assas. Pp. 100. Price 2 fr.]
- Télégraphie sans Fil.** E. Petit and L. Bouthillon. [Paris: Librairie Delagrave, 15, Rue Soufflot. Fourth edition. Pp. vii+304. Price 15 fr.]
- T.S.F. et la Guerre.** E. Sinturel. [Lyon: Imprimeries Réunies, 8, rue Rachais. Second edition, 1921. Pp. 64. Price 15 fr.]

- Télégraphie sans Fil et la Loi.** A. Perret-Maisonneuve. [Paris: H. Desforges, 29, Quai des Grands-Augustins. Price 10.50 fr.]
- *Télégraphie sans Fil (la Télémechanique et la Téléphonie sans Fil à la portée de tout le monde).** R. Monier. [Paris: Librairie Dunod, 47-49, Quai des Grands-Augustins. Pp. 242. Price 5.25 fr.]
- Télégraphie sans Fil et les Ondes Électriques.** J. Boulanger et G. Ferrié [Paris: Librairie Berger-Levrault, 5-7, Rue des Beaux Arts. Ninth edition, 1918. Pp. 487. Price 15 fr. Cloth, 20 fr.]
- T.S.F. Manuel Pratique de l'Amateur.** H. Chazelle. [Paris: Librairie Desforges, 29, Quai des Grands Augustins. Price 6 fr.]
- T.S.F. par les Tubes à Vide.** Pierre Louis. [Paris: Librairie Vuibert, 63, Boulevard Saint-Germain. - 1920. Pp. 143. Price 6 fr.]
- T.S.F. Vade-mecum de l'Amateur sans-filiste.** S. Mariens. [Paris: Librairie Amat., 11, Rue de Mézières. Price 5 fr.]
- Télégraphie sans Fil (Réception des Signaux Horaires et des Télégrammes Météorologiques).** Docteur P. Corret. [Paris: Edition du Cosmos, 5, Rue Bayard. Pp. 125. Price 2 fr.]
- *Télégraphie sans Fil dans les Rapports Internationaux.** Devaux Jacques. [A. Pedone, 1914. Price 4.80 fr.]
- Télégraphie sans Fil pour Tous.** F. Duroquier. [Paris: E. Orlhac, 1, rue Dante. Pp. 66. Price 3 fr.]
- T.S.F. Postes Récepteurs.** E. Monier. [Paris: Dunod, 47-49, Quai des Grands-Augustins. Second edition. 1917. Pp. iv+122. Price 2 fr.]
- Télégraphie et Téléphonie sans Fil.** C. Gutton. [Paris: Librairie Armand Colin, 103, Boulevard Saint-Michel. 1921. Pp. 188. Price 5 fr., or 6 fr. bound.]
- *Téléphonie sans Fil.** Scheidt-Boon. [Valenciennes: 36, Rue de Mons. 1914.]
- Théorie de la T.S.F. par Analogies Mécaniques.** P. Dapsence. [Paris, XIe: G. Péricaud, 85, Boulevard Voltaire. Second edition. Pp. 92. Price 1.75 fr.]
- Théorie de Maxwell et les Oscillations Hertiennes. La Télégraphie sans Fil.** H. Poincaré. [Paris: Gauthier-Villars et Cie., 55, Quai des Grands-Augustins. Third edition. 1908. Pp. 100. Price 6 fr.]
- Théorie Générale de l'Electromagnetisme.** G. E. Pineau. [Paris: Dunod, 47-49, Quai des Grands-Augustins. Pp. 72. Price 7 fr.]
- Théorie Simplifiée de la Télégraphie sans Fil.** Verdurand. [Paris: Dunod, 47-49, Quai des Grands-Augustins. 1917. Price, 4 fr.]
- Tubes à Vide.** Paul Dapsence. [Paris XIe: G. Péricaud, 85, Boulevard Voltaire. Second edition. 1921. Pp. 50. Price 2.50 fr.]
- Vocabulaire de Télégraphie et de Téléphonie sans Fil en Cinq Langues.** H. Viard. [Paris: Gauthier-Villars et Cie., 55, Quai des Grands-Augustins. Pp. x+108. Price 15 fr.]

GERMANY.

- Das drahtlose Telegraphieren u. Fernsprechen.** H. Thürn. [Berlin: Rich. Dietze. Third edition. 1921.]
- Die Funkentelegraphie.** C. W. Collatz. [Berlin: George Siemens. Third edition, 1921.]
- Die Neuere Entwicklung der Funkentelegraphie.** H. Wigge. [Cothen-Anhalt: Verlag der Ingenieur-Zeitung. Second edition, 1921. Pp. v+71, with 59 illustrations.]
- Drahtlose Telegraphie und ihr Einfluss auf den Wirtschftsverkehr, unter besonderer Berücksichtigung des Systems Telefunken.** E. Nesper. [Berlin: Julius Springer. 1905. Price M. 4.95.]
- Drahtlose Telegraphie.** G. Eichhorn. [Berlin, W.10.: Walter de Grayter & Co. 1904. Price 5s.]
- *Drahtlose Telegraphie und Telephonie.** G. Partheil. [Berlin: Gerdes und Hadel. Second edition, 1911. Price M. 6.]

- Einführung in die Elektrotechnik Unter Zugrundelegung der Vorlesungen.** Professor Slaby. Revised by Otto Nairz. [Leipzig: J. A. Barth. Pp. viii+415. Price M. 25.20.]
- Einführung in die moderne drahtlose Telegraphie und ihre Praktische Verwendung.** Hugo Mosler. [Brunswick: Friedrich Vieweg und Sohn, 1920. Pp. 240, with 218 figures. Price M. 24.]
- Elektrische Lichtbogen.** H. Th. Simon. [Leipzig: Hirzel, Königstrasse, 2. 1911. Price 1s. 5d.]
- *Elektrischen Wellentelegraphie.** O. Arendt. [Brunswick: Fr. Vieweg und Sohn. 1907. Price M. 10.5.]
- *Elektromagnetische Schwingungen und Drahtlose Telegraphie.** J. Zenneck. [Stuttgart: Ferd. Enke. 1905. Price M. 28.]
- Elektromagnetische Schwingungen und Wellen.** Josef Geitler. [Brunswick: Vieweg u. Sohn, 1921. Second edition. Price M. 38.]
- Entdeckungsfahrten in den elektrischen Ozean.** A. Slaby. [Berlin: Leonhard Simion. 1911.]
- *Experimentelle Untersuchungen aus dem Grenzgebiet zwischen drahtloser Telegraphie und Luftelektrizität.** M. Dieckmann. [Berlin: Julius Springer. 2 vols., 1912. Price M. 4.95.]
- *Fortschritte auf dem Gebiete der drahtlosen Telegraphie.** A. Prasch. [Stuttgart: Ferd. Enke. 1906. Price M. 8.40.]
- Frequenzmesser und Dämpfungsmesser.** E. Nesper. [Berlin, W.10: Walter de Grayter & Co. 1907. Price 11s.]
- *Funkentelegraphie.** A. Slaby. [Berlin: Julius Springer. 1897. Price M. 2.]
- Funkentelegraphie im Recht.** H. Thurn. [Munich: J. Schweitzer, 1913. Price M. 6.]
- Funkentelegraphie für Flugzeuge.** E. Niemann. [Berlin: R. C. Schmidt & Co. 1921. Pp. 410, with 343 figures. Price M. 120.]
- Grundriss der Funkentelegraphie in gemeinverständlicher Darstellung.** F. Fuchs. [Munich: R. Oldenburg. Eleventh edition, 1920. Pp. 73.]
- Handbuch der drahtlosen Telegraphie und Telephonie.** Nesper. [Berlin: Julius Springer. Two volumes. 1921.]
- Handbuch für Funkentelegraphisten.** O. Ohlsberg. [Berlin: Decker. Second edition, 1918.]
- *Lehrbuch der Drahtlosen Telegraphie.** J. Zenneck. [Stuttgart: Ferd. Enke. 1916. Price M. 15.]
- Lehrbuch der Drahtlosen Telegraphie und Telephonie.** Franz Anderle. [Leipzig and Vienna: Franz Deuticke. Fifth edition, 1922. Price 8s. 5d.]
- Leitfaden der Drahtlosen Telegraphie für die Luftfahrt.** Max Dieckmann. [Munich: R. Oldenburg. Pp. 214.]
- Lichtbogen als Wechselstromerzeuger.** H. K. W. Wagner. [Leipzig: S. Hirzel, Königstrasse 2. 1910.]
- *Physik des Aethers auf Elektromagnetischer Grundlage.** P. Drude. [Stuttgart: Ferd. Enke. New edition, edited by W. König. 1912. Price M. 16.]
- *Physikalische Grundlagen der Elektrotechnik.** F. F. Martens. [Brunswick: Vieweg und Sohn. Second edition. Price M. 21.]
- Radiotelegraphie.** O. Nairz. [Leipzig: J. A. Barth. 1908.]
- *Radiotelegraphische Gleichstrom-Tonsender.** H. Rein. [Berlin: Julius Springer. 1912.]
- Radiotelegraphisches Praktikum.** H. Rein and K. Wirtz. [Berlin: Julius Springer. Revised edition. 1921. Pp. xviii+557. Price M. 120.]
- *Telegraphie ohne Draht.** A. Righi and B. Dessau. [Brunswick: Vieweg und Sohn. Second edition, 1907. Price M. 24.75.]
- *Telegraphie und Telephonie ohne Draht.** Otto Jentsch. [Berlin: Julius Springer. 1904. Price M. 5.]

- *Telephonie ohne Draht.** H. Markau. [Brunswick: Vieweg und Sohn. Second edition, 1907. Price M. 7.8.]
- Von Morse bis Marconi.** A. Neuberger. [Ullstein & Co.]
- Wellentelegraphie.** Hanns Gunther. [Stuttgart: Francksche Verlagshandlung, 1921. Pp. 112, with 61 figures. - Price M. 6.60, or M. 9.80 bound.]

GREAT BRITAIN.

- A Catalogue of British Scientific and Technical Books (Including Wireless).** Prepared by a Committee of the British Science Guild. [London: The British Science Guild. 1921. Pp. xviii+376. Price 10s. net.]
- A Dictionary of Applied Physics.** Edited by Sir R. Glazebrook. 5 Vols. Vol. II., Electricity. [London: Macmillan & Co., Ltd., St. Martin's Street. Price 63s. net or £14 14s. the set.]
- A Short Course in Elementary Mathematics and their Application to Wireless Telegraphy.** S. J. Willis. [London: The Wireless Press, Ltd., 12/13, Henrietta Street, W.C.2. 1917. Pp. 182. Price 5s.]
- Admiralty Handbook of Wireless Telegraphy, 1920.** [London: H.M. Stationery Office. 1920. Pp. viii+477. Price 7s. 6d. net.]
- Alexanderson System for Radio Telegraph and Radio Telephone Transmission.** Elmer E. Bucher. [New York: Wireless Press Inc., London; The Wireless Press, Ltd., 12-13, Henrietta Street, W.C.2. 1920. Pp. 55. Price 10s. 6d. net.]
- Alternating Current Work.** W. Perren Maycock. [London: I. Pitman & Sons, Ltd., Parker Street, Kingsway, W.C.2. Second edition. Pp. 420, with 260 illustrations. Price 10s. 6d.]
- Alternating Current Work: An Outline for Students of Wireless Telegraphy.** A. Shore, A.M.I.E.E. [London: The Wireless Press, Ltd., 12/13, Henrietta Street, W.C.2. 1919. Pp. ix+163. Price 3s. 6d.]
- Amateur Operator's Diary and Notebook 1920.** [London: The Wireless Press, Ltd., 12/13, Henrietta Street, W.C.2. Price 3s. 6d.]
- Arithmetic of Telegraphy and Telephony.** T. E. Herbert and R. G. de Wardt. [London: Sir Isaac Pitman & Sons, Ltd. 1921. Pp. vii+187, with 37 diagrams. Price 5s.]
- Autobiography of an Electron.** Charles R. Gibson, F.R.S.E. [London: Seely, Service & Co., 38, Great Russell Street, W.C.1. 1911. Pp. 215. Price 5s. net.]
- Calculation and Measurement of Inductance and Capacity.** W. H. Nottage, B.Sc. [London: The Wireless Press, Ltd., 12/13, Henrietta Street, W.C.2. 1916. Pp. 144. Price 3s. 6d.]
- Continuous Wave Wireless Telegraphy (Part I).** W. H. Eccles, D.Sc. [London: The Wireless Press, Ltd., 1921. Pp. vii+407, with 306 diagrams. Price 25s. net.]
- Decimal Tables.** Sir G. L. Molesworth, K.C.I.E., M.Inst.C.E. [London: E. and F. N. Spon, 57, Haymarket, S.W.1. 1919. Pp. 118. Price 2s. 6d.]
- Direction and Position Finding by Wireless.** R. Keen, B.Eng., A.M.I.E.E. [London: The Wireless Press, Ltd. Pp. 376. Price 9s.]
- Directive Wireless Telegraphy, Direction and Position Finding, etc.** L. H. Walter, M.A., A.M.I.E.E. [London: Sir Isaac Pitman & Sons, Ltd., 1921. Pp. xii+124, with 57 diagrams and illustrations. Price 2s. 6d. net.]
- Electric Discharges, Waves and Impulses and other Transients.** C. P. Steinmetz, A.M., Ph.D. [London: McGraw-Hill Publishing Co., Ltd. Second edition. Pp. 167, with 72 illustrations. Price 12s. 6d. net.]
- Electric Oscillations and Electric Waves.** G. W. Pierce, Ph.D. [New York: McGraw-Hill Book Co., Inc.; London: McGraw-Hill Publishing Co., Ltd. 6/8, Bouverie Street, E.C. 4. Pp. ix+517. Price 25s. net.]

- Electric Waves.** H. Hertz. (Translated by D. E. Jones, B.Sc.). [London: *Macmillan & Co., Ltd.*, St. Martin's Street, W.C.2. Second edition, 1900. Pp. 298. Price 12s. 6d.]
- Electrician's Handy Book.** T. O'Connor Sloane, A.M., E.M., Ph.D. [London: *Henry Frowde and Messrs. Hodder & Stoughton*. Fifth edition. 1920. Pp. 823. Price 27s. 6d. net.]
- Electron Theory of Matter.** O. W. Richardson. [London: *Cambridge University Press*, Fetter Lane, E.C.4. Price 21s.]
- Electromagnetic Theory.** O. Heaviside. [London: *Benn Bros., Ltd.*, reprinted 1922, 3 Vols. Price £5 5s.]
- Electromagnetic Theory of Light.** Part I. C. E. Curry, Ph.D. [London: *Macmillan & Co., Ltd.*, St. Martin's Street, W.C.2. Pp. 416. Price 12s.]
- Electron Theory: a Popular Introduction to the New Theory of Electricity and Magnetism.** E. E. Fournier-d'Albe, B.Sc. [London: *Longmans, Green & Co.*, 39, Paternoster Row, E.C.4. 1906. Pp. xxii+312. Price 7s. 6d.]
- Elements of Electromagnetic Theory of Light.** L. Silberstein, Ph.D. [London: *Longmans, Green & Co.*, 39, Paternoster Row, E.C. 1919. Pp. 48. Price 4s. 6d.]
- Elements of Radiotelegraphy.** Ellery W. Stone, Mem.I.R.E. [New York: *D. van Nostrand Co.* London: *Crosby, Lockwood & Son*, 7, Stationers' Hall Court, E.C. 1920. Pp. vii+267. Price 16s. 6d. net.]
- Elementary Lessons in Electricity and Magnetism.** Silvanus P. Thompson, D.Sc., F.R.S. [London: *Macmillan & Co., Ltd.*, St. Martin's Street, W.C.2. New edition—1915. Price 5s. 6d.]
- Elementary Manual of Radiotelegraphy and Radiotelephony for Students and Operators.** Dr. J. A. Fleming, F.R.S. [London: *Longmans, Green & Co.*, 39, Paternoster Row, E.C.4. Third edition—New impression, 1919. Pp. xiv+355, with 194 illustrations. Price 10s. 6d.]
- Elementary Practical Mathematics.** F. Castle, M.I.M.E. [London: *Macmillan & Co., Ltd.*, St. Martin's Street, W.C.2. Price 4s.]
- Elementary Principles of Wireless Telegraphy.** Parts I and II. R. D. Bangay. [London: *The Wireless Press, Ltd.*, 12/13, Henrietta Street, W.C.2. 1918. Pp. 212. Price 4s. each; in 1 vol., 7s. 6d.]
- Elements of Electromagnetic Theory.** S. J. Barnett, Ph.D. [London: *Macmillan & Co., Ltd.*, St. Martin's Street, W.C.2. Price 12s. 6d. net.]
- Emission of Electricity from Hot Bodies.** O. W. Richardson, F.R.S. [London: *Longmans, Green & Co.*, 39, Paternoster Row, E.C.4. Second edition. 1921. Pp. viii+320, with 35 diagrams. Price 16s. net.]
- Engineering Mathematics.** C. P. Steinmetz, A.M., Ph.D. [London: *McGraw-Hill Publishing Co.*, 6/8, Bouverie Street, E.C.4. Third edition. Pp. 321. Price 17s. 6d. net.]
- Experimental Wireless Stations.** Philip E. Edelman, E.E. [London: *Henry Frowde and Messrs. Hodder & Stoughton*. Revised edition, 1920. Pp. x+392, with 166 illustrations. Price 16s. net.]
- Experiments with Alternate Currents of High Potential and High Frequency** Nikola Tesla. [New York: *McGraw-Hill Book Co., Inc* London: *McGraw-Hill Publishing Co., Ltd.*, 6/8, Bouverie Street, E.C.4. 1914. Pp. 174, with 42 illustrations. Price 5s.]
- Fifty Years of Electricity.** J. A. Fleming, M.A., D.Sc, F.R.S. [London: *The Wireless Press, Ltd.* 1921. Pp. xi+371. Price 30s. net.]
- Final Digest for Wireless Students.** J. Henstock. [Glasgow: *Jas. Munro*, 60, Brown Street. Third edition. 1918. Pp. 90. Price 4s. 6d.]
- Formulae and Tables for the Calculation of Alternating Current Problems.** Louis Cohen. [New York: *McGraw-Hill Book Co. Inc* London: *McGraw-Hill Publishing Co., Ltd.*, 6/8, Bouverie Street, E.C.4. Pp. 281. Price 17s. 6d.]

- The Framework of Wireless Telegraphy: A New Theory of Electric Wave Sources and Propagation with Rational Applications.** R. C. Galletti di Cadillhac. [London: *Crosby Lockwood & Son*, 1921. Pp. 48, with 6 diagrams. Price 3s. 6d. net.]
- Handbook of Technical Instruction for Wireless Telegraphists.** J. C. Hawkhead. Revised by H. M. Dowsett, M.I.E.E. [London: *The Wireless Press, Ltd.*, 12/13, Henrietta Street, W.C.2. Second edition—Fifth impression, 1918. Pp. 344. Price 7s. 6d.]
- *Handbook of Wireless Telegraphy.** Dr. J. Erskine-Murray. [London: *Crosby, Lockwood & Son*, 7, Stationers' Hall Court, E.C.4. Pp. 458, with 200 illustrations.] *New edition in preparation.*
- High-Frequency Apparatus.** By Thomas S. Curtis. [London: *Page & Co.* 1921. Pp. 269, with 150 diagrams. Price not stated.]
- *Hints for Wireless Designs for Amateurs.** "Alfred." [London: *Benn Bros., Ltd.*, 8, Bouverie Street, E.C.4. 1914. Pp. 55. Price 3s.]
- History of the Theories of Aether and Electricity, from the Age of Descartes to the Close of the Nineteenth Century.** Dr. E. T. Whittaker, D.Sc., F.R.S. [London: *Longmans, Green & Co.*, 39, Paternoster Row, E.C.4. Price 12s. 6d.]
- How to Become a Wireless Operator.** Charles B. Hayward. [London: *Crosby, Lockwood & Son*, 7, Stationers' Hall Court, E.C.4. Price 12s.]
- How to Conduct a Radio Club.** E. E. Bucher. [New York: *Wireless Press Inc.* London: *The Wireless Press, Ltd.*, 12/13, Henrietta Street, W.C.2. 1919. Pp. 148. Price 5s. net.]
- How to Pass U.S. Government Wireless License Examinations.** E. E. Bucher. [New York: *Wireless Press, Inc.* London: *The Wireless Press, Ltd.*, 12/13, Henrietta Street, W.C.2. Price 3s. net.]
- Intermediate Text Book of Magnetism and Electricity.** G. F. Woodhouse, M.A. [Sedbergh, Yorks: *Jackson & Son*. Revised, with additions, 1919. Price 7s. 6d.]
- Ionic Valve: a Guide to the Study of its Development and Application to Wireless Work.** W. D. Owen, A.M.I.E.E. [London: *I. Pitman & Sons, Ltd.*, Parker Street, Kingsway, W.C.2. Pp. vii+59. Price 2s. 6d. net.]
- Magnets and Electric Currents.** J. A. Fleming, M.A., D.Sc. [London: *E. and F. N. Spon*, 57, Haymarket, S.W.1. Third edition. 1902. Pp. xv+408, with 136 illustrations. Price 6s. net.]
- Magnetism and Electricity for Beginners.** H. E. Hadley, B.Sc. [London: *Macmillan & Co.*, St. Martin's Street, W.C.2. Price 3s. 6d.]
- Magnetism and Electricity for Home Study.** H. E. Penrose. [London: *The Wireless Press, Ltd.*, 12/13, Henrietta Street, W.C.2. 1918. Pp. 515. Price 6s.]
- Magnetism and Electricity for Students.** H. E. Hadley, B.Sc. [London: *Macmillan & Co.*, St. Martin's Street, W.C.2. Price 7s.]
- Maintenance of Wireless Telegraph Apparatus.** P. W. Harris. [London: *The Wireless Press, Ltd.*, 12/13, Henrietta Street, W.C.2. Second impression, 1918. Pp. x+127. Price 2s. 6d.]
- Making Wireless Outfits: an Explanation of the Construction and Use of an Inexpensive Wireless Equipment for Sending and Receiving up to 100 Miles.** Newton Harrison, E.E. [London: *E. and F. N. Spon, Ltd.*, 57, Haymarket, S.W.1. Second edition, 1918. Pp. 61. Price 2s. 6d. net.]
- Manual de Instrucción Técnica para Operadores de Telegrafía sin Hilos.** J. C. Hawkhead and H. M. Dowsett. Translated by C. Ortega. [London: *The Wireless Press, Ltd.*, 12/13, Henrietta Street, W.C.2. Pp. xvi+332. Price 9s. net.]

- Manual of Radiotelegraphy.** Captain S. S. Robison, U.S.N. [Annapolis, U.S.A.: *The United States Naval Institute*. London: *S. Rennell & Co., Ltd.*, 36, Maiden Lane, W.C.2. Fifth edition, 1919. Price 10s. net.]
- Marine Wireless Pocket Book.** W. H. Marchant. [London: *I. Pitman & Sons, Ltd.*, Parker Street, Kingsway, W.C.2.] *In the Press.*
- *Maxwell's Theory and Wireless Telegraphy.** H. Poincaré and F. K. Vreeland. [New York: *McGraw-Hill Book Co. Inc.* London: *McGraw-Hill Publishing Co., Ltd.*, 6/8, Bouverie Street, E.C.4. Price 10s. 6d.]
- Methods of Measuring Electrical Resistance.** E. F. Northrup, Ph.D. [London: *McGraw-Hill Publishing Co., Ltd.*, 6/8, Bouverie Street, E.C.4. Pp. 390. Price 22s. 6d.]
- Military Signal Corps Manual.** Major J. A. White. [New York: *Wireless Press Inc.* London: *The Wireless Press, Ltd.* Price 12s. 6d. net.]
- Miscellaneous Papers.** H. Hertz. Translated by D. E. Jones and G. A. Schott. [London: *Macmillan & Co., Ltd.*, St. Martin's Street, W.C.2. Price 12s. 6d. net.]
- Modern High-Speed Influence Machines, their Principles, Construction and Applications to Radiography, Radiotelegraphy, Spark Photography, Electro-Culture, Electro-Therapeutics, High-Tension Gas Ignition, the Testing of Materials, etc.** V. E. Johnson, M.A. [London: *E. and F. Spon, Ltd.* 1921. Pp. viii+278, with 23 illustrations. Price 14s. net.]
- Modern Theory of Physical Phenomena, Radio-activity, etc.** Augusto Righi. Translated by A. Trowbridge. [London: *Macmillan & Co., Ltd.*, St. Martin's Street, W.C.2. Pp. 180. Price 6s.]
- Morse Made Easy: a New Card for Rapidly Learning the Morse Code.** [London: *The Wireless Press, Ltd.*, 12/13, Henrietta Street, W.C.2. Price 3½d.]
- Oscillation Valve.** R. D. Bangay. [London: *The Wireless Press, Ltd.*, 12/13, Henrietta Street, W.C.2. 1919. Pp. 215. Price 6s. net.]
- Plans and Specifications for Wireless Telegraph Sets.** A. F. Collins. Part I: One to Five Miles. [London: *E. and F. N. Spon, Ltd.*, 57, Haymarket, S.W.1. New edition. 1915. Pp. 47, with 37 illustrations. Price 2s. 6d.]
- Plans and Specifications for Wireless Telegraph Sets.** Part II: Five to Ten Miles. [London: *E. and F. N. Spon, Ltd.*, 57, Haymarket, S.W.1. 1912. Pp. 72 with 62 illustrations. Price 2s. 6d. net.]
- Pocket Book (the Wireless Telegraphists') of Notes, Formulae and Calculations.** (Containing Formulae, Tables and Examples of Calculations Required in Practical Radiotelegraphy.) J. A. Fleming, M.A., D.Sc., F.R.S. [London: *The Wireless Press, Ltd.*, 12/13, Henrietta Street, W.C.2. 1915. Pp. 347. Price 9s.]
- Pocket Dictionary of Technical Terms Used in Wireless Telegraphy.** Harold Ward. [London: *The Wireless Press, Ltd.*, 12/13, Henrietta Street, W.C.2. New edition, 1919. Pp. 253. Price 2s. 6d.]
- Practical and Experimental Wireless Telegraphy.** W. J. Shaw. [London: *E. and F. N. Spon, Ltd.*, 57, Haymarket, S.W.1. 1914. Pp. 102, with 42 illustrations. Price 5s. net.]
- Practical Telephone Handbook.** J. Poole, A.M.I.E.E. [London: *I. Pitman & Sons, Ltd.*, Parker Street, Kingsway, W.C.2. Sixth edition, with 585 illustrations. Price 15s. net.]
- Practical Amateur Wireless Stations.** Compiled by J. A. White. [New York: *Wireless Press, Inc.* London: *The Wireless Press, Ltd.*, 12/13, Henrietta Street, W.C.2. Pp. 136. Price 5s. net.]
- Practical Uses of the Wavemeter in Wireless Telegraphy.** J. O. Mauborgne, [New York: *McGraw-Hill Book Co. Inc.* London: *McGraw-Hill Publishing Co., Ltd.*, 6/8, Bouverie Street, E.C.4. Pp. 74. Price 6s. 3d.]
- *Practical Wireless Slide Rule.** Dr. H. R. Hickman. [London: *Benn Bros., Ltd.*, 8, Bouverie Street, E.C.4. Price 3s. 6d.]

- Practical Wireless Telegraphy.** E. E. Bucher. [New York: *Wireless Press, Inc.* London: *The Wireless Press, Ltd.*, 12/13, Henrietta Street, W.C.2. Pp. 352. Price 12s. 6d. net.]
- Prepared Radio Measurements with Self-Computing Charts.** Ralph R. Batcher, E.E. [New York: *Wireless Press Inc.* London: *The Wireless Press, Ltd.*, 12/13, Henrietta Street, W.C.2. 1921. Pp. 132. Price 10. 6d. net.]
- Principes Élémentaires de Télégraphie sans Fil.** R. D. Bangay. [London: *The Wireless Press, Ltd.*, 12/13, Henrietta Street, W.C.2. Pp. xii + 249. Price 9s.]
- Principios Elementales de Telegrafia sin Hilos.** R. D. Bangay. Translated by C. Ortega. Parts I and II. [London: *The Wireless Press, Ltd.*, 12/13, Henrietta Street, W.C.2. Price 10 pesetas (9s. net.)]
- Principles and Practice of Electrical Testing as applied to Apparatus, Circuits and Machines.** R. G. Allen, B.Sc., A.R.C.Sc.I., A.M.I.E.E. [London: *Longmans, Green & Co.*, 39, Paternoster Row, E.C.4. Pp. 363. Price 18s. net.]
- Principles of Electric Wave Telegraphy and Telephony.** Dr. J. A. Fleming, F.R.S. [London: *Longmans, Green & Co.*, 39, Paternoster Row, E.C.4. Fourth edition, revised 1919. Pp. xv + 707. Price 42s. net.]
- Principles of Radio Communication.** J. H. Morecroft (Assistant Professor of Electrical Engineering, Columbia University), Assisted by A. Pinto and W. A. Curry. [New York: *John Wiley & Sons, Inc.* London: *Chapman & Hall, Ltd.*, 11, Henrietta Street, W.C.2. 1921. Pp. x + 935. Price 45s. net.]
- Principles of Radiotelegraphy.** C. M. Jansky. [New York: *McGraw-Hill Book Co. Inc.* London: *McGraw-Hill Publishing Co., Ltd.*, 6/8, Bouverie Street, E.C.4. Pp. 242, with 179 illustrations. Price 12s. 6d. net.]
- Principles of Wireless Telegraphy.** G. W. Pierce, Ph.D. [London: *McGraw-Hill Publishing Co., Ltd.* 6/8, Bouverie Street, E.C.4. Pp. 350, with 235 illustrations. Price 15s.]
- Radio Communication.** John Mills. [New York: *McGraw-Hill Book Co. Inc.* London: *McGraw-Hill Publishing Co., Ltd.*, 6/8, Bouverie Street, E.C.4. 1918. Pp. 210. Price 10s.]
- Radiodynamics.** B. F. Meissner. [London: *Crosby, Lockwood & Son*, 7, Stationers' Hall Court, E.C.4. Pp. 206. Price 12s.]
- Radio Engineering Principles.** H. Lauer, B.S., and H. L. Brown, B.E.E. [New York: *McGraw-Hill Book Co. Inc.* London: *McGraw-Hill Publishing Co., Ltd.*, 6/8, Bouverie Street, E.C.4. Pp. xv + 300. with 250 illustrations and 8 plates. Price 17s. 6d. net.]
- Radio Instruments and Measurements.** [New York: *Wireless Press Inc.* London: *The Wireless Press, Ltd.*, 12/13, Henrietta Street, W.C.2. Pp. 320. Price 9s. net.]
- Radiotelegraphy.** C. C. F. Monckton. [London: *Constable & Co.*, 10/12, Orange Street, Leicester Square, W.C.2. 1908. Pp. 289. Price 7s. 6d.]
- Radiotelephony.** A. N. Goldsmith, Ph.D. [New York: *Wireless Press Inc.* London: *The Wireless Press, Ltd.*, 12/13, Henrietta Street, W.C.2. Pp. 256. Price 15s. net.]
- Radio Questions and Answers.** A. R. Nilson. [New York: *McGraw-Hill Book Co. Inc.* London: *McGraw-Hill Publishing Co., Ltd.*, 6/8, Bouverie Street, E.C.4. 1922. Pp. 92. Price 5s. net.]
- Radio-Telegraphist's Guide and Log Book.** W. H. Marchant. [London: *I. Pitman & Sons, Ltd.*, Parker Street, Kingsway, W.C.2. Price 5s. 6d. net.]
- Scientific Ideas of To-day.** Charles R. Gibson, F.R.S.E. [London: *Seeley, Service & Co.*, 38, Great Russell Street, W.C.1. Pp. 344. Price 7s. 6d. net.]

- Selected Studies in Elementary Physics.** A Handbook for the Wireless Student and Amateur. E. Blake, A.M.I.E.E. [London: *The Wireless Press, Ltd.*, 12/13, Henrietta Street, W.C.2. Pp. viii+176. Price 5s. net.]
- Selenium Cells.** T. W. Benson. [London: *E. & F. W. Spon, Ltd.*, 57, Haymarket, S.W.1. 1919. Pp. 68, with 18 illustrations. Price 7s. 6d. net.]
- Simple Fault Tracing for Wireless Students and Operators.** S. W. Brown. [Glasgow: *Jas. Munro*, 60, Brown Street. 1919. Pp. 414. Price 1s. 6d.]
- Standard Tables and Equations in Radiotelegraphy.** Bertram Hoyle. [London: *The Wireless Press, Ltd.*, 12/13, Henrietta Street, W.C.2. 1919. Pp. 159. Price 9s.]
- *Story of Wireless Telegraphy.** Alfred T. Story. [London: *Hodder & Stoughton*, St. Paul's House, Warwick Square, E.C.4. Pp. 225. Price 1s.]
- Studies in Terrestrial Magnetism.** Dr. C. Chree, F.R.S. [London: *Macmillan & Co., Ltd.*, St. Martin's Street, W.C.2. Price 6s. 6d.]
- Submarine Telegraphs, with an Appendix on Wireless Telegraphy.** Charles Bright, F.R.S.E. [London: *Crosby, Lockwood & Son*, 7, Stationers' Hall Court, E.C.4. Pp. 800. Price £3 3s.]
- Telegraphy, Telephony and Wireless.** Joseph Poole. [London: *I. Pitman & Sons, Ltd.*, Parker Street, Kingsway, W.C.2. Pp. 120, with 68 illustrations. Price 3s. net.]
- Telephony without Wires.** P. R. Coursey, B.Sc., A.M.I.E.E. [London: *The Wireless Press, Ltd.*, 12/13, Henrietta Street, W.C.2. 1919. Pp. xi+414. Price 15s. net.]
- Telephonic Transmission, Theoretical and Applied.** J. G. Hill. [London: *Longmans, Green & Co.*, 39, Paternoster Row, E.C.4. Pp. xvi+398, with 196 diagrams. Price 21s. net.]
- Test Questions in Wireless Telegraphy.** In Card Form: Three Series. (These Test Cards are based on the "Elementary Principles of Wireless Telegraphy," "Handbook of Technical Instruction for Wireless Telegraphists," and other well-known textbooks.) [London: *The Wireless Press, Ltd.*, 12/13, Henrietta Street, W.C.2. Price 2s. 6d. each series; answers separate.]
- Textbook on Wireless Telegraphy.** R. Stanley, B.A., M.I.E.E. In 2 vols.: (I) General Theory and Practice: pp. xiii+471, with 255 figures; (II) Valves and Valve Apparatus; pp. viii+357, with 227 figures. [London: *Longmans, Green & Co.*, 39, Paternoster Row, E.C.4. 1919. Price 15s. each vol.]
- Theory and Calculation of Transient Electric Phenomena and Oscillations.** C. P. Steinmetz, A.M., Ph.D. [London: *McGraw-Hill Publishing Co., Ltd.*, 6/8, Bouverie Street, E.C.4. Third edition. 1920. Pp. 696, with 113 illustrations. Price 30s. net.]
- Thermionic Valve and its Developments in Radiotelegraphy and Telephony.** J. A. Fleming, D.Sc., F.R.S. [London: *The Wireless Press, Ltd.*, 12/13, Henrietta Street, W.C.2. 1919. Pp. xv+280. Price 15s.]
- Thermionic Tubes in Radiotelegraphy and Telephony.** John Scott-Taggart, A.M.Am.I.E.E. [London: *The Wireless Press, Ltd.*, 12/13, Henrietta Street, W.C.2. 1921. Pp. xxiii+424, with 344 diagrams. Price 25s. net.]
- The Signal Service in the European War of 1914-1918 (France).** R. E. Priestley, M.C., B.A. (late Major R.E.). Published by the Secretary of the Institution of Royal Engineers, and by the Signals Association. [Chatham: *W. & J. MacKay & Co., Ltd.* 1921. Pp. xvi+359. Price not stated.]

- The Thermionic Vacuum Tube and its Applications.** H. J. van der Bijl. [New York: McGraw-Hill Book Co., Inc., London: McGraw-Hill Publishing Co., Ltd., 6/8, Bouverie Street, E.C.4. 1921. Pp. 391, with 232 illustrations. Price 25s. net.]
- Useful Notes on Wireless Telegraphy.** H. E. Penrose. In Five Booklets. Book I, "Direct Current," pp. 65; Book II, "Alternating Current," pp. 50; Book III, "High Frequency Current and Wave Production," pp. 66; Book IV, "The Marconi $1\frac{1}{2}$ kW Ship Set," pp. 77; Book V, "The Oscillation Valve," pp. 53. [London: The Wireless Press, Ltd., 12/13, Henrietta Street, W.C.2. 1919. Price 1s. 4d. each.]
- Vacuum Tubes in Wireless Communication.** E. E. Bucher. [New York: Wireless Press Inc. London: The Wireless Press, Ltd., 12/13, Henrietta Street, W.C.2. Pp. 202. Price 12s. 6d. net.]
- Waves and Ripples in Water, Air and Aether.**—Being a Course of Lectures delivered at the Royal Institution of Great Britain. J. A. Fleming, M.A., D.Sc., F.R.S., etc. [London: Society for Promoting Christian Knowledge, 6, St. Martin's Place, W.C.2. Pp. 300. Price 7s. 6d.]
- Wireless Design and Practice. Part I.—Transmitters and Receivers. Part II.—Practical Circuits.** M. B. Sleeper. [London: Henry Frowde and Messrs. Hodder & Stoughton. 1920. Pp. 246. Price 7s. 6d.]
- Wireless Experimenter's Manual, Incorporating How to Conduct a Radio Club.** Elmer E. Bucher. [New York: Wireless Press Inc. London: The Wireless Press, Ltd., 12/13, Henrietta Street, W.C.2. 1920. Pp. 335. Price 12s. 6d. net.]
- Wireless Explained.** F. Cross. [Glasgow: James Brown, 52/58, Darnley Street, Pollokshields. 1918. Pp. 72. Price 3s. 6d.]
- Wireless Operator's Diary and Note Book.** Published annually. A Leather Pocket-Book, with Diary and Notebook specially ruled for Wireless Operators. [London: The Wireless Press, Ltd., 12/13, Henrietta Street, W.C.2. 1920. Price 3s. 6d.]
- Wireless Telegraphy: Its History, Theory and Practice.** A. F. Collins. [New York: McGraw-Hill Book Co., Inc. London: McGraw-Hill Publishing Co., Ltd., 6/8, Bouverie Street, E.C.4. Pp. 300, with 332 illustrations. Price 15s. net.]
- Wireless Telegraphy.** Professor C. Fortescue. [London: Cambridge University Press, Fetter Lane, E.C.4. Price 2s. 6d. net.]
- Wireless Telegraphy.** Gustav Eichhorn, Ph.D. [London: Charles Griffin & Co., Ltd., 12, Exeter Street, W.C.2. 1906. Pp. x+116. Price 10s. 6d. net.]
- Wireless Telegraphy.** W. H. Marchant. [London: I. Pitman & Sons, Ltd., Parker Street, Kingsway, W.C.2. Second edition, 1920. Pp. ix+305, with 201 illustrations. Price 7s. 6d.]
- Wireless Telegraphy and Hertzian Waves.** S. R. Bottone. [London: I. Pitman & Sons, Ltd., Parker Street, Kingsway, W.C.2. Fifth edition, revised by C. Sylvestre, A.M.I.E.E. Price 3s. 6d. net.]
- Wireless Telegraphy.** J. Zenneck. Translated by A. E. Seelig, M.A.M.I.E.E. [London: McGraw-Hill Publishing Co., Ltd., 6/8, Bouverie Street, E.C.4. Pp. 428, with 461 illustrations. Price 25s. net.]
- Wireless Telegraphy: With Special Reference to the Quenched Spark System.** B. Leggett, A.M.I.E.E. [London: Chapman & Hall, Ltd., 11, Henrietta Street, W.C.2. 1921. Pp. xv+385. Price 30s. net.]
- Wireless Telegraphy: A Handbook on the Fundamental Principles and Modern Practice of Radiotelegraphy for the use of Students of Electrical Engineering.** A. B. Rolfe-Martin. [London: A. & C. Black, Ltd., 4/6, Soho Square, W.1. 1914. Pp. 256. Price 3s. 6d.]
- Wireless Telegraphy and Telephony: An Outline for Electrical Engineers and Others.** L. B. Turner, M.A., M.I.E.E. [London: The Cambridge University Press. 1921. Pp. xii+195. Price 20s. net.]

- *Wonders of Wireless Telegraphy and Telephony.** Wm. J. White. [London: *I. Pitman & Sons, Ltd.*, Parker Street, Kingsway, W.C.2. Pp. 202. Price 4s.]
- Wireless Telegraphy and Telephony: A Popular Account.** Charles R. Gibson, F.R.S.E. [London: *Seeley, Service & Co.*, 28, Great Russell Street, W.C.1. Pp. 156. Price 3s. 6d. net.]
- Wireless Telegraphy and Telephony: A Handbook of Formulae, Data and Information.** W. H. Eccles, D.Sc. [London: *Benn, Bros., Ltd.*, 8, Bouverie Street, E.C.4. Third edition. 1920. *New and enlarged edition in preparation.*]
- Wireless Telegraphy and Telephony: First Principles, Present Practice and Testing.** H. M. Dowsett, M.I.E.E. [London: *The Wireless Press, Ltd.*, 12/13, Henrietta Street, W.C.2. Pp. xxxi+331. Price 9s. net.]
- Wireless Telegraphy: its Theory and Practice.** Dr. J. Erskine-Murray. [London: *Crosby, Lockwood & Son*, 7, Stationers' Hall Court, E.C.4. Sixth edition. Pp. 450, with 200 illustrations. Price 12s. 6d. *New edition in preparation.*]
- Wireless Telegraphy Simply Explained.** H. T. Davidge. [London: *Percival Marshall & Co.*, Farringdon Street, E.C.4. Pp. 63. Price 9d.]
- Wireless Telephony.** Ernst Ruhmer. Translated by Dr. J. Erskine-Murray. [London: *Crosby, Lockwood & Son*, 7, Stationers' Hall Court, E.C.4. Pp. 338. Price 10s. 6d.]
- Wireless Telephone Construction.** Newton Harrison. [London: *E. and F. N. Spon, Ltd.*, 57, Haymarket, S.W.1. Pp. 74, with 43 illustrations. 1918. Price 2s. 6d.]
- Wireless Telephones and How They Work.** Dr. J. Erskine-Murray. [London: *Crosby, Lockwood & Son*, 7, Stationers' Hall Court, E.C.4. Pp. 76. Price 3s.]
- Wireless Time Signals.** [London: *E. and F. N. Spon, Ltd.*, 57, Haymarket, S.W.1. 1915. Pp. 132, with 30 illustrations and 1 plate. Price 5s.]
- Wireless Transmission of Photographs.** Marcus J. Martin. [London: *The Wireless Press, Ltd.*, 12/13, Henrietta Street, W.C.2. Revised, 1919. Pp. xv+142. Price 5s.]
- Wonders of Wireless Telegraphy Explained in Simple Terms for the Non-technical Reader.** J. A. Fleming, M.A., D.Sc., F.R.S. [London: *Society for Promoting Christian Knowledge*, 6, St. Martin's Place, W.C.2. Second edition, revised. Pp. 280. Price 7s. 6d.]

GREECE.

- Elementary Treatise on Wireless Telegraphy.** Com. R. N. Gr. Mezeviris. [Publishers: *Government Press.*]
- Handbook of Wireless Telegraphy.** Vol. 2. Com. R. N. Gr. Mezeviris. [Publishers: *Government Press.*]

HOLLAND.

- De Internationale Organisatie van het Radio-electrische Verkeer.** G. F. van Dissel. [Leyden: *A. W. Sythoff's Uitgeversmaatschappij*. Pp. 48. Price fl. 0.50.]
- De Marconi Telegrafie.** H. O. Ruyter de Wildt.
- De theoretische grondslagen van Magnetisme en Electriciteit.** Dr. Ir. N. Koomans. [The Hague: *N. Veenstra*. Price fl. 3.50.]
- Draadlooze Telegrafie.** J. R. G. Isbrücker. [Rotterdam: *Nygh en Dilmar*, Second edition. Price fl. 1.90.]
- Draadlooze Telegrafie en hare toepassingen in Nederlandsch Oost-Indie.** M. F. Onnen. [Leiden: *E. J. Brill*.]
- Draadlooze Telegrafie.** Edw. Vosmaer. [Baarn: *V. d. Ven*. Price fl. 0.75.]
- Draadlooze Telegrafie en Telefonie.** N. Koomans. [Deventer: *Kluwer*. Price fl. 1.75.]

- Draadlooze Telegrafie over den Atlantischen Oceaen.** I. van Dam.
Handleiding voor de uitoefening van den Radiotelegraafdienst. A. Walrave.
 [W. Kruijt. Eighth edition. Price fl. 2.00.]
- Het draadloos amateurstation voor den ontvangst van telegrafie en telefonie.**
 J. Corver. [The Hague: N. Veenstra. Price fl. 3.75 and fl. 5.0.]
- Het draadloos zendstation voor den amateur.** J. Corver. [The Hague
 N. Veenstra. 1920. Pp. 106. Price fl. 3.60.]
- La Telegraphie sans Fil.** I. van Dam.
- Leerboek voor aans Radiotelegraafisten en Stuurleiden.** L. F. Steehouwer.
 [Noorduyn Gorinchern. Parts I and II. Pp. 136.]
- Onderzoekingen op het gebied van Radiotelegrafie in Nederlandsch Oost-Indie.**
 [s Gravenhage: Martinus Nyhoff. 1916. Three vols. Pp. 284. Price
 fl. 7.50.]
- Radiotelegraphie in de tropen.** Dr. C. J. de Groot. [The Hague: Veenstra.
 1916. Pp. 247. Price fl. 7.50.]
- Technische Handleiding voor Adspirant Radiotelegrafisten.** A. K. Damstra
 and A. Walrave. [Published by the Authors. Third edition. Price
 fl. 3.50.]

ITALY.

- Elementi di Telegrafia senza fili.** P. Barreca. [Leghorn: Raffaello Giusti.]
- Il Radiogoniometro e la Radiotelegrafia Direttiva.** [Rome: Ufficio Marconi.]
- La Telefonía senza fili.** Umberto Bianchi. [Milan: Ulrico Hoepli, Pp
 viii+296. Price L. 10.]
- L'Optica delle Oscillazioni Elettriche.** Augusto Righi. [Bologna: Nicola
 Zanichelli. Price L. 5.]
- Manuale pratico del radiotelegrafista.** G. Della Santa. [Milan: Ulrico
 Hoepli. Pp. 171. Price L. 6.50.]
- Nozioni Elementari di Radiotelegrafia.** [Rome: Ufficio Marconi.]
- Progressi e stato attuale della Telegrafia e Telefonía senza fili.** Giuseppe
 Vanni. [Rome: Fratelli Capaccini.]
- Radiotelegrafia e Radiotelefonía.** D. Mazzotto. [Milan: Ulrico Hoepli.
 Second edition. Price L. 6.]
- Radiotelefonía.** D. Ravalico. [Turin: S. Lattes. 1920. Pp. vii+219.
 Price L. 14.]
- Telegrafia senza fili.** O. Murani. [Milan: Ulrico Hoepli. Third edition.
 Pp. 520. Price L. 10.]

JAPAN.

- Japanese Wireless Year-Book.** Musen Nenkan. [Tokyo: Musen News
 Agency, 15, Sakuradabizencho, Shiba.]
- *Popular Wireless Telegraphy and Telephony.** Masajiro Kitamura and Eigoro
 Tsumori. [Tokyo: Hobunkan, Honkokucho Nihonbashiku. Price
 yen 4.5.]
- Principles of Wireless Telegraphy and Telephony.** Dr. Binnojo Mizuno.
 [Tokyo: Marzuen Co., Tori 3 Chome, Nihonbashiku. 2 vols. Price
 yen 5.5.]
- Stories of Wireless Telegraphy and Telephony.** Eitaro Yokoyama. [Tokyo:
 Denyusha, Minamikinrokuchō, Kyobashiku. Price yen 0.7.]
- Wireless Telegraphy.** Shunkichi Kimura. [Tokyo: Uchita Rokakuho,
 Otenmachi, Nihonbashiku. Price yen 2.0.]
- Wireless Telegraphy and Telephony.** Dr. Wichi Torikata. [Tokyo:
 Hobunkan, Honkokucho, Nihonbashiku. Price yen 5.500.]
- Besides these there are a number of reports on wireless operations
 published by the Electro-Technical Laboratory.

NORWAY.

- Elementær Radiotelegrafi.** (Handbook for Wireless Operators.) B. L.
 Gottwaldt. [Christiania: H. Aschehoug and Co. Second edition. 1918.
 Price kr. 5.00.]

- Instructions to Government Wireless Operators.** Issued by the Engineer in Charge of Wireless Section of the Norwegian Telegraph Department.
***Wireless Telegraphy Manual.** Captain Hovland. Issued for use in Norwegian Navy. 1907.

PORTUGAL.

- Biblioteca do Instrucao Profissional.** Elemento do Electricidade com um capitulo que trata de T.S.F. Ex. \$1.60.
Telegraphia Electrica Aeria Submarina e Sem Fios. B. Ferrini. Translated by Adalberto Veiga, 1919. Ex. \$1.00.
T.S.F. Mariotte. Ex. \$10.
T.S.F. Separata da Revista de Electricidade e mechanica. Ex. \$6.00.
T.S.F. G. Le Petit. Frs. 9.
T.S.F. Amadeus de Vasconcellos Porto, 1907. Ex. \$10.
Telegraphia Sem Fios Biblioteca do Poco e das Escolas. (1 pamphlet.) Ex. \$0.05.

SPAIN.

- Cartilla Para el Curso de Radiotelegrafia.** Luis Blanco and Gustavo de Montaud. [*Centro Electrotécnico de Ingenieros.* Sin precio.]
Estudio de la Recepción en las Radiocomunicaciones. J. Espinosa de los Monteros. [Madrid: *Ministerio de Marina.* 1919.]
El Entretenimiento de los Aparatos Radiotelegraficos. Percy W. Harris. [Madrid: *Prensa Radiotelegrafica*, (S.A.), Alcala 43.]
La Valvula Oscilatoria. R. D. Bangay. [Madrid: *Prensa Radiotelegrafica*, (S.A.), Alcala 43.]
Manual de Instruccion Tecnica para Operadores de Telegrafia sin Hilos. J. C. Hawkhead and H. M. Dowsett. [Madrid: *Prensa Radiotelegrafica* (S.A.), Alcala 43. Pp. xvi+332. Price 11 pesetas.]
Notas Utiles : Corriente Alternativa. Harold E. Penrose. [Madrid: *Prensa Radiotelegrafica* (S.A.), Alcala 43. Price 3.50 pesetas.]
Notas Utiles : Corriente Continua. Harold E. Penrose. [Madrid: *Prensa Radiotelegrafica* (S.A.), Alcala 43. Price 3.50 pesetas.]
Notas Utiles : La Valvula Oscilatoria. Harold E. Penrose. [Madrid: *Prensa Radiotelegrafica* (S.A.), Alcala 43. Price 3.50 pesetas.]
Notas Utiles : Produccion de Corrientes de Alta Frecuencia. Harold E. Penrose. [Madrid: *Prensa Radiotelegrafica* (S.A.), Alcala 43. Price 3.50 pesetas.]
Notas Utiles : Tipo de Barco 1½ kW. Harold E. Penrose. [Madrid: *Prensa Radiotelegrafica* (S.A.), Alcala 43. Price 3.50 pesetas.]
Principios Elementales de Telegrafia sin Hilos. R. D. Bangay. [Madrid: *Prensa Radiotelegrafica* (S.A.), Alcala 43. Price 10 pesetas.]
Radiogoniometria y Recepción por cuadro. J. Espinosa de los Monteros. [Madrid: *Ministerio de Marina.* 1919.]
Radiotelefonía Espanola. Rufino Gea y Sacasa. [Madrid: *El Telegrafo Espanol.* Pp. 56. Price 4 pesetas.]
Telegrafia sin Hilos. Eugenio Agacino and Rancon Estrada. [Cadiz: *F. Rodríguez de Selve.* Price 8 pesetas.]
Telegrafia sin Hilos. E. Monier. [Price 3 pesetas.]
Telegrafia sin Hilos. Augusto Righi and Bernard Dessau. Translated from the German by Marqués de Magaz and D. Juan Rosell. [Madrid: *Ricardo Rojas, Campomanes* 8. Price 20 pesetas.]
Telegrafia sin Hilos. Francisco del Rio Joan. [Madrid: *Revista tecnica de Infanteria y Caballeria*, Passje de Valdecilla, 2. Price 9.50 pesetas.]
Telegrafia y Telefonía sin Hilos. F. Villaverde and Zubeldia. [Barcelona: *Calce.* Pp. 180.]

Teoria de Maxwell y las Oscilaciones Hertzianas. E. Poincaré. With Appendix, "Los Ultimos Adelantos de la Telegrafia sin Hilos," by P. H. Basauri, S.J. [Barcelona: *Tipografia Catolica Casals*, Caspe 108. Price 3 pesetas.]

Valvulas Termoionicas. Guillermo Ortega. [Madrid: *Prensa Radiotelegrafica* (S.A.), Alcala 43. Price 1.50 pesetas.]

SWEDEN.

Handbok i Radiotelegrafi. J. Gunnar Holmstrom. [Stockholm.]

Lärobok i Trädlös Telegrafi. F. Zethraeus.

Principiell Tramställning af Glödkatodrörens Veikningssätt samt användning vid Mottagning irom Radiotelegrafen af. Siffer Lemoine.

Trädlös Telegrafi. Thor Thörnblad.

SWITZERLAND.

Die moderne drahtlose Telegraphie : Demonstrationsvortrag. Dr. Gustav Eichhorn. [Zurich: *Institut Artistique Orell Fussli*. 1906. Pp. 27. Price 1.20 fr.]

Drahtlose Telegraphie im internen Recht und Völkerrecht. Dr. Fr. Meilo. [Zurich: *Institut Artistique Orell Fussli*. Price 4 fr.; cloth, 5 fr.]

UNITED STATES.

Alexanderson System for Radio Telegraph and Radio Telephone Transmission. Elmer E. Bucher. [New York: *The Wireless Press Inc.* London: *The Wireless Press, Ltd.* 1920. Pp. 55. Price 10s. 6d.]

Construction of a Trans-Atlantic Wireless Receiving Set. L. G. Pacent and T. S. Curtis. [New York: *Henley Publishing Co.*, 2, West 45th Street. Pp. 36. Price 35 cents.]

Directions for Designing, Making and Operating High-Pressure Transformers. Professor F. E. Austin. [Hanover, N.H.: *Published by the Author*. Price 75 cents.]

Electric Discharges, Waves and Impulses and other Transients. C. P. Steinmetz, A.M., Ph.D. [New York: *McGraw-Hill Book Co. Inc.* London: *McGraw-Hill Publishing Co., Ltd.* Second edition. Pp. 167, with 72 illustrations. Price 12s. 6d. net.]

Electric Oscillations and Electric Waves. G. W. Pierce, Ph.D. [New York: *McGraw-Hill Book Co. Inc.* London: *McGraw-Hill Publishing Co., Ltd.* Pp. ix+517. Price 25s. net.]

Electricity at High Pressures and Frequencies. H. L. Transtrom. [Chicago: *The Joseph G. Branch Publishing Co.* Second edition. 1921. Pp. xi+247. Price \$2.50.]

Elements of Radiotelegraphy. E. W. Stone. [New York: *D. Van Nostrand & Co.*, 25, Park Place. Pp. 265. Price \$2.50.]

Engineering Mathematics. C. P. Steinmetz, A.M., Ph.D. [New York: *McGraw-Hill Book Co., Inc.* London: *McGraw-Hill Publishing Co., Ltd.* Third edition. Pp. 321. Price 17s. 6d. net.]

Examples in Alternating Currents. Professor F. E. Austin. [Hanover, N.H.: *Published by the Author*. Price \$2.65.]

Examples in Magnetism. Professor F. E. Austin. [Hanover, N.H.: *Published by the Author*. Price \$1.25.]

***Experimental Wireless Stations.** P. E. Edelman. [New York: *Henley Publishing Co.*, 2, West 45th Street. Pp. 320. Price \$3.00.]

Experiments with Alternate Currents of High Potential and High Frequency. Nikola Tesla. [New York: *McGraw-Hill Book Co. Inc.* London: *McGraw-Hill Publishing Co., Ltd.*, 6/8, Bouverie Street, E.C.4. 1914. Pp. 174, with 42 illustrations. Price 5s.]

- Formulae and Tables for the Calculation of Alternating Current Problems.** Louis Cohen. [New York: McGraw-Hill Book Co. Inc. London: McGraw-Hill Publishing Co., Ltd., 6/8, Bouverie Street, E.C.4. Pp. 282. Price 17s. 6d.]
- Generator and Motor Examples.** Professor F. E. Austin. [Hanover, N.H.: Published by the Author. Price \$2.75.]
- How to Conduct a Radio Club.** E. E. Bucher. [New York: Wireless Press Inc., 326, Broadway. 1919. Pp. 148. Price 75 cents.]
- How to Make Low-Pressure Transformers.** Professor F. E. Austin. [Hanover, N.H.: Published by the Author. Price 90 cents.]
- How to Pass U.S. Government Wireless License Examinations.** E. E. Bucher. [New York: Wireless Press Inc., 326, Broadway. Price 75 cents.]
- Induction Coils in Theory and Practice.** Professor F. E. Austin. [Hanover, N.H.: Published by the Author. Price \$1.25.]
- Laboratory Experiments with Direct Currents.** Professor F. E. Austin. [Hanover, N.H.: Published by the Author. Price \$1.75.]
- Manual of Radiotelegraphy and Telephony for the use of Naval Electricians.** S. S. Robison, U.S.N. With revisions and additions by Capt. D. W. Todd, U.S.N., and Lieut.-Commdr. S. C. Hooper, U.S.N. [Annapolis, Md.: The United States Naval Institute. Fifth edition, 1920. Pp. 307. Price \$2.50 net.]
- *Maxwell's Theory and Wireless Telegraphy.** H. Poincaré and F. K. Vreeland. [New York: McGraw-Hill Book Co. Inc. London: McGraw-Hill Publishing Co., Ltd., 6/8, Bouverie Street, E.C.4. Price 10s. 6d.]
- Methods of Measuring Electrical Resistance.** E. F. Northrup, Ph.D. [New York: McGraw-Hill Book Co. Inc. London: McGraw-Hill Publishing Co., Ltd., 6/8, Bouverie Street, E.C.4. Pp. 390. Price 22s. 6d.]
- Military Signal Corps Manual.** Major J. A. White. [New York: Wireless Press Inc., 326, Broadway. Price \$2.25.]
- Operators' Wireless Telegraph Handbook: Treatise on Construction and Operation of Wireless Telegraph and Telephone.** V. H. Laughter. [Chicago: F. J. Drake and Co. Pp. 180. Price \$1.25.]
- Practical Amateur Wireless Stations.** Compiled by J. Andrew White, Editor of the *Wireless Age*. [New York: The Wireless Press, Inc., 326, Broadway. Pp. 136. Price 75 cents.]
- Practical Uses of the Wave Meter in Wireless Telegraphy.** J. O. Mauborgne. [New York: McGraw-Hill Book Co. Inc. London: McGraw-Hill Publishing Co., Ltd., 6/8, Bouverie Street, E.C.4. Pp. 74. Price 6s. 3d.]
- Practical Wireless Telegraphy.** E. E. Bucher. [New York: Wireless Press Inc., 326, Broadway. Pp. 352. Price \$2.25.]
- Preliminary Mathematics.** Professor F. E. Austin. [Hanover, N.H.: Published by the Author. Price \$1.25.]
- Prepared Radio Measurements with Self Computing Charts.** Ralph R. Batcher, E.E. [New York: Wireless Press, Inc. London: The Wireless Press, Ltd. 1921. Pp. 132. Price 10s. 6d. net.]
- Principles of Radio Communication.** J. H. Morecroft. Assisted by A. Pirito and W. A. Curry. [New York: John Wiley & Sons, Inc. Pp. xx+935. Price 45s. net.]
- Principles of Radiotelegraphy.** C. M. Jansky. [New York: McGraw-Hill Book Co. Inc. London: McGraw-Hill Publishing Co., Ltd., 6/8, Bouverie Street, E.C.4. Pp. 242, with 179 illustrations. Price 12s. 6d.]
- *Principles Underlying Radio-Communication.** Signal Corps, U.S.A. [Washington: Government Printing Office, 1919. Pp. 355. Price 55 cents. New edition in Preparation.]

- Radio Communication.** John Mills. [New York: McGraw-Hill Book Co. Inc. London: McGraw-Hill Publishing Co., Ltd., 6/8, Bouverie Street, E.C.4. 1918. Pp. 210. Price 10s. net.]
- Radio Engineering Principles.** H. Lauer, B.S., and H. L. Brown, B.E.E. [New York: McGraw-Hill Book Co., Inc. London: McGraw-Hill Publishing Co., Ltd. Pp. xv+300 with 250 illustrations and 8 plates. Price 17s. 6d. net.]
- Radio Instruments and Measurements.** [New York: Wireless Press Inc., 326, Broadway. Pp. 320. Price \$1.75.]
- Radio-telephony.** Dr. A. N. Goldsmith, B.Sc., Ph.D. [New York: Wireless Press Inc., 326, Broadway. Pp. 256. Price \$2.50.]
- Radio Questions and Answers.** A. R. Nilson. [New York: McGraw-Hill Book Co., Inc. London: McGraw-Hill Publishing Co., Ltd. 1922. Pp. 92. Price 5s. net.]
- Report of the Chief Signal Officer of the U.S. Army to the Secretary of War, U.S.A., 1920.** [Washington: Government Printing Office. 1920. Pp. 64.]
- Report of the Director of the Air Service to the Secretary of War, U.S.A.** [Washington: Government Printing Office, 1920. Pp. 49.]

World
- (C) Call Signs of British Experimental
Stations
- (D) Regular Transmission

AMATEUR AND EXPERIMENTAL WIRELESS

By HUGH S. Pocock, Editor of *The Wireless World and Radio Review*.

IN the following article it is proposed to give a *résumé* of wireless activities in the amateur field during the year 1922, with special reference to Great Britain, whilst elsewhere in this volume there appears an account of the work done in the way of commercial developments in wireless telegraphy and telephony.

Certainly many progressive steps have been made in all branches of the science during the year 1922, and the amateur has shared in these developments, whilst at the same time consolidating his position and assuring his status with the Authorities in whose hands is vested the control of the licenses under which the experimenter enjoys privileges.

The most progressive step taken in this country during the past year is undoubtedly the introduction of the scheme for Broadcasting by wireless and the amateur may reasonably claim the honour of having, to some extent, "promoted" broadcasting in this country through a Petition made to the Authorities by all the principal Wireless Societies of the United Kingdom headed by the Wireless Society of London (now the Radio Society of Great Britain), for authority to be given for a regular transmission of telephony once a week. This Petition was presented to the Post Office Authorities in December, 1921. Within a fortnight the necessary permission was granted and transmissions started from the station of the Marconi Scientific Instrument Company at Writtle, near Chelmsford.

These transmissions may therefore be regarded as the first official Broadcasting to be conducted in the United Kingdom.

The first announcement regarding the proposals for extensive Broadcasting was made just three months later by the Postmaster-General in the House of Commons. At the time of writing, after a series of delays, the Broadcasting service has commenced and one by one the various stations which are to conduct transmissions from eight different centres are opening up.

An enormous increase in public interest in wireless has resulted, partly from the direct appreciation of the possibilities of Broadcasting and partly owing to the publicity which has been given to the subject drawing the interest of many persons to the fascinating possibilities of wireless as a hobby, and as a subject for investigation quite apart from Broadcasting.

Broadcasting has, however, brought with it certain problems which have claimed the attention of the amateur as well as the professional, particularly in respect to the amateur who is licensed to transmit. The wavelengths authorised for the Broadcast transmissions are very close to the wavelength of 440 metres which hitherto has been the principal wavelength on which amateur transmissions have been conducted. This has virtually necessitated the confinement of amateur transmissions to much shorter wavelengths authorised as an alternative to the 440 metre wave.

This matter was the subject of meetings of transmitting license holders in the London area, called by the Radio Society of Great Britain towards

the end of 1922, when certain proposals for regulating amateur transmissions were adopted including the abolition of spark and tonic train transmissions by amateurs.

Transmission tests between British and American Amateurs have again during 1922 attracted a great deal of interest. In 1921, it will be remembered, successful reception by British amateurs was made of American amateur transmissions on short wavelengths and with power limited to 1 kW. output. On that occasion Mr. Paul F. Godley, an American amateur, was sent over here to attempt to receive the American stations on American apparatus. He, together with a number of British amateurs, was successful.

In 1922, in addition to further efforts to receive American transmissions, certain British amateur transmitting stations also made the attempt to bridge the Atlantic. At the time of writing, a very large number of American amateur stations have again been heard on this side, and the transmissions from this side have also met with success.

What is even more remarkable an achievement than the transatlantic transmission of amateur stations transmitting continuous wave, is the fact that early in December a report was made by a British amateur of the reception of the American telephony Broadcasting station of Newark, New Jersey. This first report was quickly followed by a very large number of others, some amateurs being able to give details of the entire Broadcast programme of Newark and other American stations. Considering that the Broadcast stations on the other side are not licensed to use excessive power, these results are truly remarkable. So many reports have been made and verified that these results can no longer be regarded as "freak" receptions.

As regards technical developments in amateur wireless in this country two lines of research have perhaps received special attention. These are, small power telephony transmitters and practical developments in high frequency amplification. Whereas during 1921 there were comparatively few amateurs conducting successful experiments in telephony, now nearly all the amateurs who have experimental licenses have forsaken Morse transmissions in favour of telephony which presents so much wider a field for investigation. The other subject which has attracted the attention of the serious experimenter, viz :—high frequency amplification dates, so far as the general amateur in this country is concerned, from the period of preparation for the Transatlantic tests in 1921. It is not suggested, of course, that prior to this date the amateur was unacquainted with amplification at radio frequency, but at the same time such circuits had not been in very general use. The necessity for radio frequency amplification was not so apparent until it became a question of the reception of very weak signals. At present there is perhaps a better practical acquaintance with such circuits amongst the more advanced amateurs in this country than can be shown anywhere else except by those professionally engaged in the design of apparatus.

The number of stations licensed for experimental work and for transmission has increased enormously during 1922. An idea of this increase may be gauged by a comparison of the list of transmitting stations published in this volume with the corresponding list in the last volume, yet even this list does not give all those licensed to transmit since many station owners prefer to withhold the permission necessary for particulars to be published. A year ago a rough estimate was made of the stations licensed in this country for experimental work. The figures arrived at showed 250 transmitting stations and about 6,000 receiving stations. To-day a very conservative estimate would give the number of transmitting stations as 700, whilst the receiving stations licensed for experimental work amount probably to at least 30,000, without taking into account the stations licensed for Broadcast reception only.

Further evidence of the development of amateur wireless in Great Britain is obtainable from records of the Radio Society of Great Britain. As the Wireless Society of London there were affiliated to this body at the end of 1921 approximately 60 local wireless societies. At the present time there are upwards of 150 Societies united in this way, and the membership of all the societies continues to increase with astonishing rapidity.

The Transatlantic Tests have shown what is possible in the way of long distance communication by amateurs with small power. In France during the past year facilities have been given by the Government for the establishment of experimental stations and two way communication has been conducted without any difficulty between stations in this country and France at as great a distance as Nice. From Italy, Scandinavia and Germany also reports are made of reception of transmissions by British Amateurs, although the majority of these transmitters are only licensed for the small power of ten watts.

In view of these achievements it is not surprising that the amateur has earned for himself public recognition and support. As a culminating mark of distinction H.R.H. the Prince of Wales has shown his interest by becoming the Patron of the Radio Society of Great Britain. The Society is thereby more than ever in a position to support the interests of the amateur and voice his feelings and wishes whenever collective effort is required in any representations to the authorities controlling the terms of licenses. "Unity is strength" is an ancient saying but it nevertheless applies to the most modern of sciences particularly where the interest of the amateur is concerned. Through joining a Society the amateur takes the best course in ensuring his position, for the Societies acting in concord and headed up by the Radio Society of Great Britain have a very strong voice in the management of affairs which intimately concern each individual amateur.

DIRECTORY OF THE WIRELESS SOCIETIES OF THE WORLD

THE following list has been brought as up-to-date as circumstances would allow. Wireless Societies, however, are constantly being formed, and it is possible that particulars may have been received too late for insertion. Every endeavour has been made to present a thoroughly reliable list, but no responsibility can, however, be accepted for any possible inaccuracies.

EXPERIMENTAL WIRELESS TRANSMITTING STATIONS

Call Letters.	Power in Watts.	System of Transmission.	Name and Address.
2 AA	—	—	Radio Communication Company (Slough Experimental Station).
2 AF	—	C.W.	A. Rickard Taylor, 49, Idmiston Road, W. Norwood.
2 AG	—	C.W.	A. Rickard Taylor, 49, Idmiston Road, W. Norwood.
2 AH	—	C.W.	Oxford.
2 AK	—	Spark C.W. and Telephony	R. M. Radio, Ltd., Townslead Mills, Worcester.
2 AL	—	C.W. and Telephony	W. Halstead, Briar Royd, Briar Lane, Thornton-le-Fylde.
2 AN	—	C.W. and Telephony	A. W. Sharman, Kelvin Lodge, 1, Morella Road, S.W.
2 AO	10	Spark, C.W. and Telephony	O. H. Relly, Stratton, De Roos Road, Eastbourne.
2 AQ	—	Spark, C.W. and Telephony	Davis, Thornton Heath, London, S.W.
2 AR	—	—	E. Gaze, 3, Archibald Street, Gloucester.
2 AU	—	—	A. C. Bull, 25, Fairland Road, West Ham, E.15.
2 AV	10	Telephony	D. H. W. Swiney, 18, Southchurch Road, Southend-on-Sea, Essex. 'Phone, 380.
2 AW	100	C.W. and Telephony	H. H. Burbury, Crigglestone, Wakefield.
2 AX	10	—	Geo. Sutton, 18, Melford Road, S.E.22.
2 AY	10	Portable station, C.W., T.T. and Telephony.	Dudley F. Owen, Limehurst, Sale, near Manchester.
2 AZ	—	Spark, C.W. and Telephony	William Le Queux.
2 BC	10	C.W., T.T. and Telephony	Dudley F. Owen, Limehurst, Sale, near Manchester.
2 BM	—	C.W. and Telephony	J. H. A. Whitehouse, 25, Ennersdale Road, New Brighton, Cheshire.
2 BZ	10	C.W. and Telephony	Basil Davis, Pavilion, Marble Arch, W.1.
2 CA	—	—	J. H. Reyner, 69, Station Road, Chingford.
2 CB	—	C.W. and Telephony	W. E. Cooke, 29, Empress Avenue, South Chingford.
2 CH	10	Spark, C.W. and Telephony	Science Society, The School, Oundle, Northants.

Experimental Wireless Transmitting Stations—(continued).

Call Letters.	Power in Watts.	System of Transmission.	Name and Address.
2 CI	10	Spark - - -	R. Brooks King, Widcombe, Taunton.
2 CM	—	Spark quenched gap and C.W.	Norman D. B. Hyde, 92, Littledale Road, Egremont, Cheshire.
2 CO	10	Spark and C.W. -	J. C. Elmer, 14, Gordon Square, Birchington, Kent.
2 CP	—	—	Portable, 10 miles from above.
2 CZ	10	Spark, C.W. Tonic-Train and Telephony	C. Atkinson, 17, Beaumont Road, Leicester.
2 DC	10	C.W. and Telephony	M. Child, 60, Ashworth Mansions, Maida Vale.
2 DD	10	Spark - - -	A. C. Davis, 105, Brynland Avenue, Bristol.
2 DF	10	Spark, T.T., C.W. and Telephony	R. E. Miller, 65, Malden Road, New Malden, Surrey.
2 DG	10	—	W. Barnett, 63, Mount Road, Parkwood Springs, Sheffield.
2 DH	10	Spark and C.W. -	W. Barnett, 63, Mount Road, Parkwood Springs, Sheffield. Portable Set.
2 DI	10	Spark and C.W. -	W. Barnett, 63, Mount Road, Parkwood Springs, Sheffield. Portable Set.
2 DJ	10	C.W. and Telephony	A. T. Lee, The Court, Alvaston, Derby.
2 DT	—	—	Barrow and District Wireless Association.
2 DU	10	C.W. and Telephony	W. D. Norbury, 51, Chilwell Road, Beeston, Notts.
2 DX	10 & 50	C.W. and Telephony	W. K. Alford, "Rosedene," Camberley, Surrey.
2 DY	—	—	F. Haynes, 5, Regent Square, W.C.1.
2 DZ	—	—	—
2 FA	—	—	F. G. Bennett, 16, Tivoli Road, Crouch End, N.8.
2 FB	10	Spark, C.W. and Telephony	W. Ison, 80, Harnham Road, Salisbury.
2 FG	—	Spark, C.W. and Telephony	L. McMichael, 32, Quex Road, W. Hampstead.
2 FH	10	C.W. and Telephony	T. S. Rogers, 2, Park Hill, Moseley, Birmingham.
2 FL	100, 50	Spark, C.W. and Telephony	C. Willcox, 21, George Street, Warminster, Wilts.
2 FM	—	C.W. and Telephony	V. Corelli, 41a, Grove Road, Eastbourne.
2 FN	10	—	L. Baker, Ruddington, Notts.
2 FP	10	Spark, Telephony, C.W. and T.T.	F. Foulger, 118, Pepys Road, S.E. 14.
2 FQ	—	C.W. and Telephony	Burndept Ltd., Experimental Station, Blackheath.

Experimental Wireless Transmitting Stations—(continued).

Call Letters.	Power in Watts.	System of Transmission.	Name and Address.
2 FR	10	C.W. and Telephony	S. Rudeforth, 54, Worthing Street, Hull.
2 FT	—	C.W. and Telephony	Edinburgh and District Radio Society.
2 FU	10	Spark, C.W. and Telephony	E. T. Manley, Jr., 49, Arthur Road, Wimbeldon Park, S.W.19.
2 FW	—	Spark	Rev. D. Thomas, St. Paul's B.P. Scouts, Bournemouth. Also Portable Set.
2 FX	—	Spark, C.W., T.T. and Telephony	H. C. Binden, Bournemouth.
2 FZ	10 and 1 kw	Spark, C.W. and Telephony	Manchester Wireless Society, Headquarters, Albion Hotel, Piccadilly, Manchester. Also portable set, same details and call sign.
2 GA	10	Spark	Rev. J. A. Gibson, 18, Daniel Street, Bath.
2 GD	10	For Indoor Transmissions only	Birmingham Wireless Experimental Club, Digbeth Institute, Birmingham.
2 GG	—	—	A. H. Kidd.
2 GJ	—	—	Park View, Hindehouse Lane, Firk Park, Sheffield.
2 GL	10	C.W. and Telephony	W. J. Henderson, 2, Hollywood Road, S.W.10.
2 GP	10	Spark, C.W. and Telephony	Wilfrid Gartland, 14, Baalbec Road, London, N.5.
2 GQ	10	Spark	1st Taunton Scouts, Parish Buildings, Wilton, Taunton (also portable).
2 GR	10	Spark, C.W. and Telephony	Thomas Forsyth, Wenslea, Ashington, Northumberland.
2 GS	10	Spark, C.W. and Telephony	Thomas Forsyth, Wenslea, Ashington, Northumberland. Portable set.
2 GT	—	—	Gilbert Irvine, 12, Treborth Street, Liverpool. Portable set.
2 GU	10	—	Halifax Wireless Club.
2 GV	10	Spark, C.W. and Telephony	Rev. W. P. Rigby, St. Lawrence Vicarage, Bristol.
2 GW	10	C.W. and Telephony	Allan Cash, Foxley Mount, Lymm, Cheshire.
2 GZ	—	C.W. and Spark	A. L. Megson, Bowdon.
2 HA	—	C.W. and Spark	A. L. Megson, Bowdon. Portable set.
2 HB	10	Spark, C.W. and Telephony	L. H. Lomas, Highfield, Sammerseat, near Manchester.
2 HC	10	C.W. and Spark	J. W. White, Windcombe Lodge, Bucklesbury, near Reading.
2 HF	—	—	W. G. Gold, "Rosedale," Belwell Lane, Four Oaks, near Birmingham.
2 HG	10	Spark	T. Boutland, Senr., Ashington, Northumberland.

Experimental Wireless Transmitting Stations—(continued).

Call Letters.	Power in Watts.	System of Transmission.	Name and Address.
2 HH	10	Spark - - -	T. Boutland, Junr., Ashington, Northumberland.
2 HK	—	—	A. A. Campbell Swinton, Chester Square, W.
2 HP	10	C.W. and Telephony	H. C. Woodhall, 10, Holborn House, E.C.1.
2 HQ	10	C.W. and Spark -	A. W. Fawcett, 11, Leigh Road, Clifton, Bristol.
2 HR	10	C.W. and Telephony	F. O. Read & Co., Ltd., 13-14, Great Queen Street, Kingsway, W.C.2.
2 HS	—	Telephony and Tonic Train, C.W. and Telephony	G. W. Hale and R. Lyle, 36, Dagnall Park, South Norwood, S.E.25.
2 HT	—	Spark, C.W. and Telephony	R. H. Klein, 18, Crediton Hill, W. Hampstead, N.W.6.
2 HV	10	Telephone - - -	H. Beresford, Wylde Green, Birmingham.
2 HW	10	Telephone - - -	H. Beresford, Wylde Green, Birmingham.
2 HX	—	Spark, C.W. and Telephony	F. A. Love, Ivydene, Guildford Park Road, Guildford.
2 IB	10	C.W. and Telephony	W. Bemrose, Littleover Hill, Derby.
2 ID	10	C.W. and Spark -	E. S. Firth, Thames Ditton.
2 IF	10	C.W. and Telephony	S. W. Bligh, 2, North Lane, Canterbury.
2 IH	—	—	Technical College, Cardiff.
2 II	10	Spark - - -	Southport Wireless Society, 74a, Kensington Road, Southport.
2 IJ	—	—	Southport Wireless Society, 74a, Kensington Road, Southport. Portable set.
2 IK	10	C.W. and Telephony	County High School for Boys, Altrincham, Cheshire.
2 IL	10	Telephony - - -	H. R. Goodall, "Fernlea," Winchester Road, Bassett, Southampton.
2 IN	10	C.W., Spark and Telephony	J. E. Fish, "Thornleigh," Thornton-le-Fylde, near Blackpool.
2 IQ	—	C.W. and Telephony	W. A. Ward, 26, Marlborough Road, Sheffield.
2 IS	—	—	Rev. W. H. Doudney, St. Luke's Vicarage, Bath.
2 IT	—	Portable Set - - -	Rev. W. H. Doudney, St. Luke's Vicarage, Bath.
2 IU	10	—	G. A. E. Roberts, Twyford, Winchester.
2 IV	10	Spark, C.W. and Telephony	L. F. White, Priory Road, Knowle, Bristol.
2 IW	10	—	G. R. Marsh, Twyford, Winchester.
2 IX	10	C.W. and Telephony	S. G. Taylor, Littleover, Derby.
2 IY	10	—	J. Briggs, City School of Wireless Telegraphy, 66, Corporation Street, Birmingham.

Experimental Wireless Transmitting Stations—(continued).

Call Letters.	Power in Watts.	System of Transmission.	Name and Address.
2 JB	—	Closed Aerial, C.W.	P. H. Dorte, Downside Wireless Society, Downside School, Stratton-on-the-Fosse, near Bath.
2 JC	10	Spark, C.W. and Telephony	I. H. Storey, "Escowbeck," Caton, Lancaster.
2 JD	250	C.W. and Telephony	
	10	Spark, C.W. and Telephony	I. H. Storey, White Cross Mills, Lancaster.
2 JF	250	C.W. and Telephony	
	10	Spark, C.W. and Telephony	C. G. Williams, 22, Scholar Street, Sefton Park, Liverpool.
2 JG	—	—	W. A. Seed, Crigglestone, near Wakefield.
2 JH	10	—	C. W. Barrand, "Stefano," Wellington Street, Slough.
2 JJ	10	—	C. Worthy, 4, Riversdale Road, Egremont, Wallasey.
2 JK	10	Spark, C.W., T.T. and Telephony	Philip R. Coursey, 138, Muswell Hill Road, N.10.

CODE

- (A) The Morse Code.
- (B) Extracts from the International Convention
on Safety of Life at Sea.
- (C) Extracts from the International Radio-tele
graphic Convention.

THE MORSE CODE

Two forms of Morse Code are in use, the "Continental Morse Code," and the "American Morse Code." The latter is now only officially recognised for use in land line telegraphs in America, so that the Continental Code is used universally in Radio work.

Continental Morse is a dot and dash system, every letter or symbol consisting of a combination of these. Considering as an element either a dot or a dash, no ordinary unaccented letter is represented by more than four elements. Some punctuation signs, numerals and whole words are represented by more than four elements.

Rules for formation of Continental Morse code :

These rules apply irrespective of the speed of transmission.

(1) The time occupied by a dash should be equal to that occupied by three dots.

(2) The time occupied by the interval between two elements of one letter or other symbol should be equal to the time occupied by one dot.

(3) The interval between two letters in a word should be equal to the time occupied by three dots.

(4) The interval between two words should be equal to the time occupied by five dots.

The following are extracted from the International Convention on Safety of Life at Sea :—

ARTICLE II.

SAFETY SIGNAL.

The radiotelegraph stations which have to transmit to ships information involving safety of navigation and being of an urgent character (icebergs, derelicts, cyclones, typhoons, sudden changes in the position or form of fixed obstructions or of land marks) shall make use of the following signal, called the safety signal, repeated at short intervals ten times at full power :

— — — (T T T)

In principle, all radiotelegraph stations receiving the safety signal shall, if the transmission of messages by them would interfere with the receipt by any other station of the safety signal and the following safety message, keep silence, in order to allow all interested stations to receive that message. This does not apply to cases of distress.

The safety message shall be transmitted one minute after the safety signal has been sent out, and shall be repeated thereafter three times at intervals of ten minutes.

The Governments of the Contracting States will select the stations which are to send out to mariners safety information of an urgent character.

When the information in question has been sent out by stations performing the time service, it shall be again sent out after the transmission of the time signal and the weather report.

ARTICLE III.
MORSE CODE.

INTERNATIONAL SIGNALS.

These signals may be made at night or in thick weather, either by long and short flashes of light, or by long and short sound signals (whistles, fog-horns, etc.), or during the day by hand flags.

1.—URGENT AND IMPORTANT SIGNALS.

You are standing into danger..	• • —
I want assistance: remain by me	• • • —
Have encountered ice	• — —
Your lights are out (<i>or</i> , burning badly)	• — — •
The way is off my ship; you may feel your way past me	• — •
Stop (<i>or</i> , heave to); I have something important to communicate	• — • •
Am disabled; communicate with me	• • — •

2.—GENERAL SIGNALS.

Meaning.	Signal.	Equivalent Letters and How Made.	How Answered.
Preparative ..	• • • • • &c.	A succession of E's in one group	By the general answer T.
Answer	—	T (singly)	
Spelling	• • — • • — •	F F in one group	By the general answer T.
Use International Code of Signals	— — — — —	M M M in one group	By the general answer T.
International Code Flag sign	— — — — —	M M in one group	
Break sign	• • • •	I I as separate letters	
Stop	• • • • •	I I I as separate letters	
Finish of the message	• • • — •	V E as one group	• — • R. — • • D. As separate letters.
Erase sign	• • • • &c.	A succession of E's as separate letters	By a succession of E's as separate letters.
Annul	W — — — W • • • — —	W W as one group	By W W as one group.
Repeat word after: (when a single word is required)	<div style="display: flex; align-items: center;"> <div style="margin-right: 10px;"> I M I W A • • • </div> <div> } I M I as one group W A as separate letters </div> </div> Followed by the word preceding the one required		By the general answer T.
Repeat all after: (if more than one word is required)	<div style="display: flex; align-items: center;"> <div style="margin-right: 10px;"> I M I A A A • — • — </div> <div> } I M I as one group A A as separate letters </div> </div>		By the general answer T.
Repeat all: (if the whole message is to be repeated)	<div style="display: flex; align-items: center;"> <div style="margin-right: 10px;"> I M I A L L — • — • • — • </div> <div> } I M I as one group A L L as separate letters </div> </div>		By the general answer T.

3.—NATIONALITY SIGNALS.

Meaning.	Signal.	Equivalent Letters and How Made
American	— • • • — • •	C D as separate letters.
Argentine	— • • • — • •	C G " "
Austro-Hungarian	— • • • — • •	C F " "
Belgian	— • • • — • •	D C " "
Brazilian	— • • • — • •	D E " "
British	— • • • — • •	F.
Bulgarian	— • • • — • •	D F as separate letters.
Chilian	— • • • — • •	D G " "
Chinese	— • • • — • •	E C " "
Colombian	— • • • — • •	E D " "
Danish	— • • • — • •	E F " "
Dutch	— • • • — • •	E G " "
French	— • • • — • •	E.
German	— • • • — • •	G.
Greek	— • • • — • •	M M in one group followed by D.
Italian	— • • • — • •	C E as separate letters.
Japanese	— • • • — • •	C.
Mexican	— • • • — • •	F C as separate letters.
Norwegian	— • • • — • •	M M in one group followed by C.
Peruvian	— • • • — • •	F D as separate letters.
Portuguese	— • • • — • •	F E " "
Russian	— • • • — • •	D.
Siamese	— • • • — • •	F G as separate letters.
Spanish	— • • • — • •	G C
Swedish	— • • • — • •	M M in " " followed by E.
Turkish	— • • • — • •	G D as separate letters.
Uruguayan	— • • • — • •	G E " "
Venezuelan	— • • • — • •	G F " "

4.—INSTRUCTIONS.

1. THE URGENT AND IMPORTANT SIGNALS may be made without the Preparative Signal being answered if it is supposed that the person addressed cannot reply, or in other special circumstances; but in this case a pause should be made between the Preparative Signal and the message.

2. THE SIGNAL • • — • • • — • • (FF) is used previous to any letters which are intended to spell words.

3. THE SIGNAL — — — — — (MMM) is used previous to any message sent by means of the International Code of Signals.

4. THE SIGNAL — — — — — (MM) means the Code Flag of the International Code of Signals, and is used as indicated in the Code Book.

5. THE BREAK SIGN is used between the address of the receiver and the text of the message, and after the message if the name of the sender is to be signalled.

6. THE STOP is used, where necessary, in the text of the signal.

7. THE ERASE is used to cancel the last word or signal group, sent by mistake.

8. THE ANNUL is used to cancel *all* the message.

9. METHOD OF ANSWERING. Each word or signal group, when understood, is to be answered by one long flash — (T).

If a word or signal group is not answered, the sender is to repeat it until answered by a long flash.

At the end of the message, if understood, the receiver will make • • — • • • • (RD).

The Erase and Annul signs are to be answered by their own signs.

10. THE NATIONALITY SIGNAL is made immediately after the answer to the Preparatory Signal has been received, to indicate the nationality of the vessel making the signal. It is answered by the nationality signal of the vessel receiving the message.

The following are extracted from the International Radiotelegraphic Convention.

APPENDIX.

II.

LIST OF ABBREVIATIONS TO BE USED IN RADIOTELEGRAPH TRANSMISSIONS.

Abbrevia- tion. 1.	Question. 2.	Answer or Advice. 3.
— • — • — • — (CQ)	Inquiry signal employed by a station which desires to correspond.
— • — • — (TR)	Signal announcing the sending of indications concerning a ship station (Article XXVIII).
— — • — • — (I)	Signal indicating that a station is about to send with high power.
PRB	Do you wish to communicate with my station by means of the International Signal Code?	I wish to communicate with your station by means of International Signal Code.
QRA	What is the name of your station?	This station is.....
QRB	How far are you from my station?	The distance between our station is..... nautical miles.
QRC	What are your true bearings?	My true bearings are.....degrees.
QRD	Where are you bound?	I am bound for.....
QRF	Where are you coming from?	I am coming from.....
QRG	To what company or line of navigation do you belong?	I belong to.....
QRH	What is your wavelength?	My wavelength is.....metres.
QRJ	How many words have you to transmit?	I have.....words to transmit.
QRK	How are you receiving?	I am receiving well.
QRL	Are you receiving badly? Shall I transmit 20 times • • • • • so that you can adjust your apparatus.	I am receiving badly. Transmit 20 times • • • • • so that I can adjust apparatus.
QRM	Are you disturbed?	I am disturbed.
QRN	Are the atmospherics very strong?	The atmospherics are very strong.
QRO	Shall I increase my power?	Increase your power.
QRP	Shall I decrease my power?	Decrease your power.
QRQ	Shall I transmit faster?	Transmit faster.
QRS	Shall I transmit more slowly?	Transmit more slowly.
QRT	Shall I stop transmitting?	Stop transmitting.
QRU	—	I have nothing to transmit.
QRV	Are you ready?	I have nothing for you.
QRW	Are you busy?	I am ready. All is in order.
QRX	Shall I wait?	I am busy with another station (or with please do not interrupt).
QRY	What is my turn?	Wait. I will call you at.....o'clock (or when I want you).
QRZ	Are my signals weak?	Your turn is No.....
QSA	Are my signals strong?	Your signals are weak.
QSB	Is my tone bad?	Your signals are strong.
QSC	Is my spark bad?	The tone is bad.
QSD	Is the spacing bad?	The spark is bad.
QSF	Let us compare watches. My time is What is your time?	The spacing is bad.
QSG	Are the radiotelegrams to be transmitted alternately or in series?	The time is.....
QSH	—	Transmission will be in alternate order.
QSI	—	Transmission will be in series of five radiotelegrams.
QSK	What is the charge to collect for....?	Transmission will be in series of ten radiotelegrams.
QSL	Is the last radiotelegram cancelled?	The charge to collect is.....
QSM	Have you got the receipt?	The last radiotelegram is cancelled.
QSN	What is your true course?	Please give a receipt.
QSO	Are you communicating with land?	My true course is.....degrees.
QSP	Are you in communication with another station (or with.....)?	I am not communicating with land.
	Shall I signal to that you are calling him?	I am in communication with (through the medium of.....).
		Inform that I am calling him.

Abbreviation.	Question.	Answer or Advice.
1.	2.	3.
QSQ	Am I being called by.....?	You are being called by.....
QSR	Will you dispatch the radiotelegram?..	I will forward the radiotelegram.
QST	Have you received a general call? ..	General call to all stations.
QSU	Please call me when you have finished (or at.....o'clock)	I will call you when I have finished.
QSV	Is public correspondence engaged? ..	Public correspondence is engaged. Please do not interrupt.
QSW	Must I increase the frequency of my spark?	Increase the frequency of your spark.
QSX	Must I diminish the frequency of my spark?	Diminish the frequency of your spark.
QSY	Shall I transmit with a wavelength of	Let us transfer to the wavelength of..... metres.
QSZ	Transmit each word twice. I have difficulty in receiving your signals.
QTA	Transmit each radiotelegram twice. I have difficulty in receiving your signals or
		Repeat the radiotelegram you have just sent. Reception doubtful.
QTB	Number of words not agreed; I will repeat first letter of each word and first figure of each group.
QTC	Have you anything to transmit? ..	I have something to transmit. I have one (or several) radiotelegrams for..

When an abbreviation is followed by a mark of interrogation it applies to the question indicated in respect of that abbreviation.

In addition to these signals, which, it will be observed, are uniform in construction, the following signals of the International Telegraph Code may be used in these communications:—

- • — • • • "Repeat" sign (as well as mark of interrogation).
- • • — • • Understood.
- — • • • • Wait.

EXAMPLES.

Station		
A	QRA?	What is the name of your station?
B	QRA Campania	This is the Campania.
A	QRG?	To what company or line of navigation do you belong?
B	QRG Cunard. QRZ	I belong to the Cunard Line. Your signals are weak.
Station A then increases the power of its transmitter and sends:—		
A	QRK?	How are you receiving?
B	QRK	I am receiving well.
	QRB 80	The distance between our stations is 80 nautical miles.
	QRC 62	My true bearings are 62 degrees, etc.
